

Challenges and prospects for radio transients detection with the Phased Array Feeds

Mateusz Malenta

Jodrell Bank Centre for Astrophysics

The people

- JBCA: M. Keith, B. Stappers
- MPIfR: R. Karuppusamy, M. Kramer, L. Spitler, G. Wieching
- CSIRO: A. Chippendale, X. Deng, D. George, G. Hobbs, S. Johnston, C. Philips

Why PAF?

- Larger field of view than with the standard receivers
- Digital beamforming
- Greater control over the beam separation – can improve localisation effort

Why PAF?

- Larger field of view than with the standard receivers
- Digital beamforming
- Greater control over the beam separation – can improve localisation effort
- New technology with a lot of room for improvements (e.g. T_{SYS})

The University of Manchester

Why not PAF?

Why not PAF?

- Bit difficult

What we work with

- Pre-channelised data: 336 '1MHz' channels
- 2 polarisations, complex sampled 16-bit data
- Beamforming done using 48 FPGAs
- Currently using 17(~50%) beams

~~VDIF2, PDIF~~, CODIF

- 7 channels, 128 time samples per packet

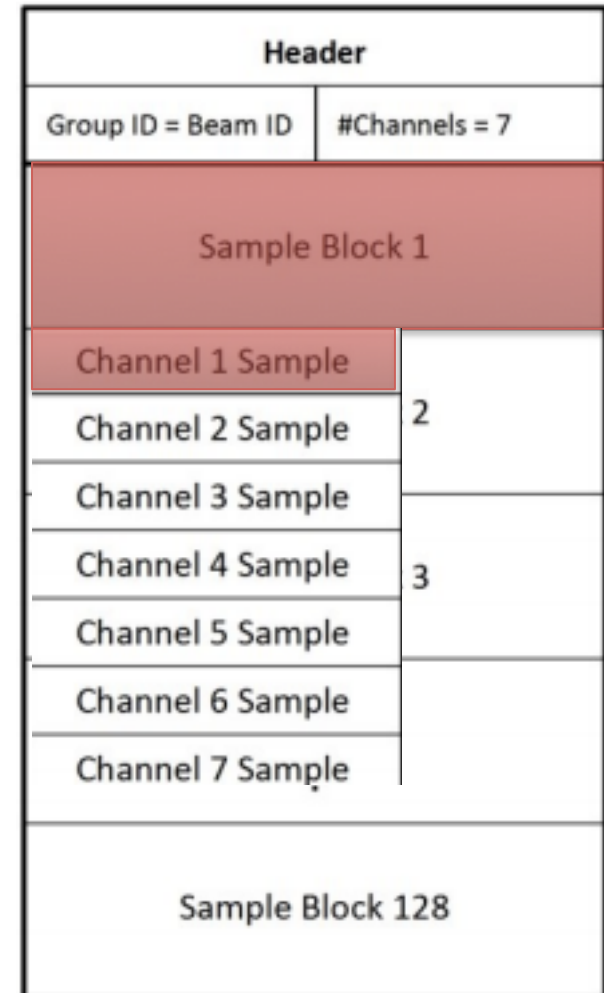

What we work with

- Pre-channelised data: 336 '1MHz' channels

~~VDIF2, PDIF, CODIF~~

- 7 channels, 128 time samples per packet

How we (aim to) search for FRBs

- Most of the work done on the GPUs
- Limit the amount of communication between CPU and GPU
- Eventually a real-time processing system

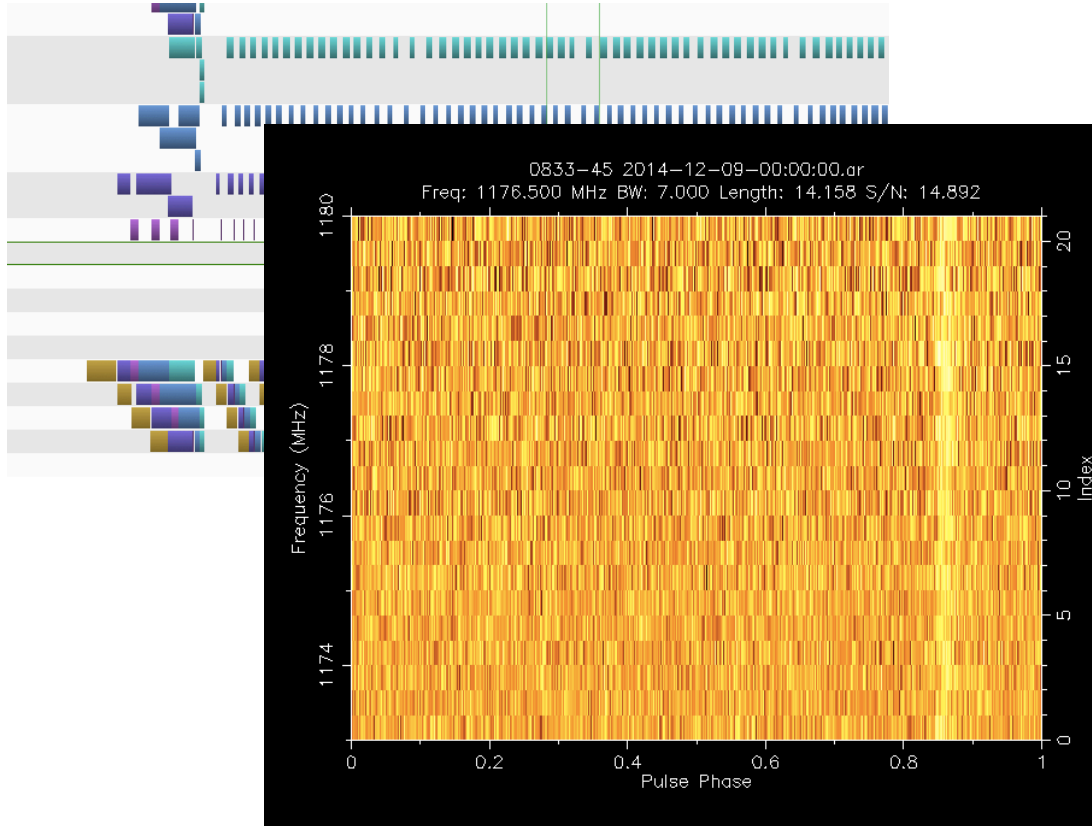

Main challenges

- **Data comes at high rates (~25Gbps per beam) – challenging to capture and process in real time**
- Work done on GPUs: takes time to launch and copy the data – need to combine the processing in larger batches
- The output data rate is still large – need a lot of RAM and disk space
- Need to coordinate processing between multiple beams

New localisation possibilities

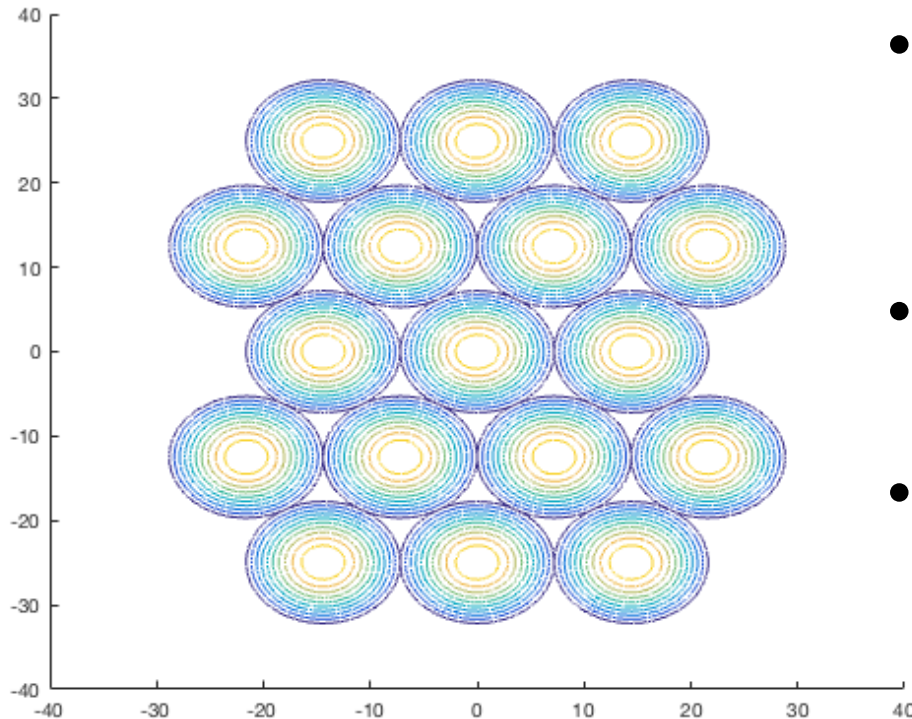

Building on the work done by Obrocka et al., 2015

- Will provide better localisation at the cost of the survey speed
- Currently trying to find the 'sweet spot'
- Experimental data will be added to the model for the first time

Building on the work done by Obrocka et al., 2015

- Will provide better localisation at the cost of the survey speed
- Currently trying to find the 'sweet spot'
- Experimental data will be added to the model for the first time

“Localisation down to 1' with PAF is **no brainer** and we should try something harder ”

Future plans

- Use the remaining time on actual science
- Apply the knowledge from Parkes to Effelsberg deployment
- Apply the knowledge from Parkes and Effelsberg to Jodrell Bank deployment

Thank you!
