

# e-MERLIN – an update on delivery

Tom Muxlow JBCA Manchester

YERAC 2011 – 19<sup>th</sup> July 2011

# Outline

**Upgrade News** – Original MERLIN transformed....

- What's delivered...
- What's still to come...

***e*-MERLIN and star-formation at high redshift:**

**Historical** – Original MERLIN studies of nearby star-forming galaxies

Constraining our models and refining our s-f rate measurements

- Deep study of  $\mu\text{Jy}$  radio sources in GOODS-N

Statistical properties of the radio population down to  $\sim\mu\text{Jy}$

**Coming soon** – The *e*-MERGE Legacy programme:

An ultra-deep *e*-MERLIN+EVLA study of the  $\mu\text{Jy}$  population

- Role of AGN feedback & mergers in triggering/controlling star-formation
- History of star-formation through cosmic time....

## e-MERLIN upgrade to UK 7-element interferometer

Baselines to  $\sim 220$  km baselines

Observing bands: 1.3-1.7, 4-8, 21-26 GHz

200 - 10 mas angular resolution

Optical fibres, new receivers, new correlator

2 GHz bandwidth fills aperture  $< 8$  GHz

$\mu$ Jy continuum sensitivity (improved by  $\sim 30$ )

Spectral line sensitivity more than doubled

High sensitivity, high fidelity imaging

# e-MERLIN progress

Optical fibres to all telescopes in place and tested

New updated broadband 1.2-1.7 and 4-8 GHz receivers

21-26 GHz under development

Broadband electronics installed (IFs etc.)

First correlator quadrant working

First images: 512MHz bandwidth between 4 - 7GHz

Characterising polarization performance

To Come.....

L-Band testing – Q3 2011

Broad-band samplers & 2GHz BW operations - Q4 2011

Transfer of timing links to fibres imminent

Some initial shared-risk observations in progress

– official shared-risk announcement Q3 2011

# Merlin Telescope Links

Original MERLIN connected by fixed-link radio masts

Astronomy returned over  $\mu$ -wave links  
– principle BW limitation

Coherence achieved via two-way  
L-Band radio timing links

Direct links to close outstations,  
multiple hops to distant telescopes  
– 5 link towers used JBO-Cm

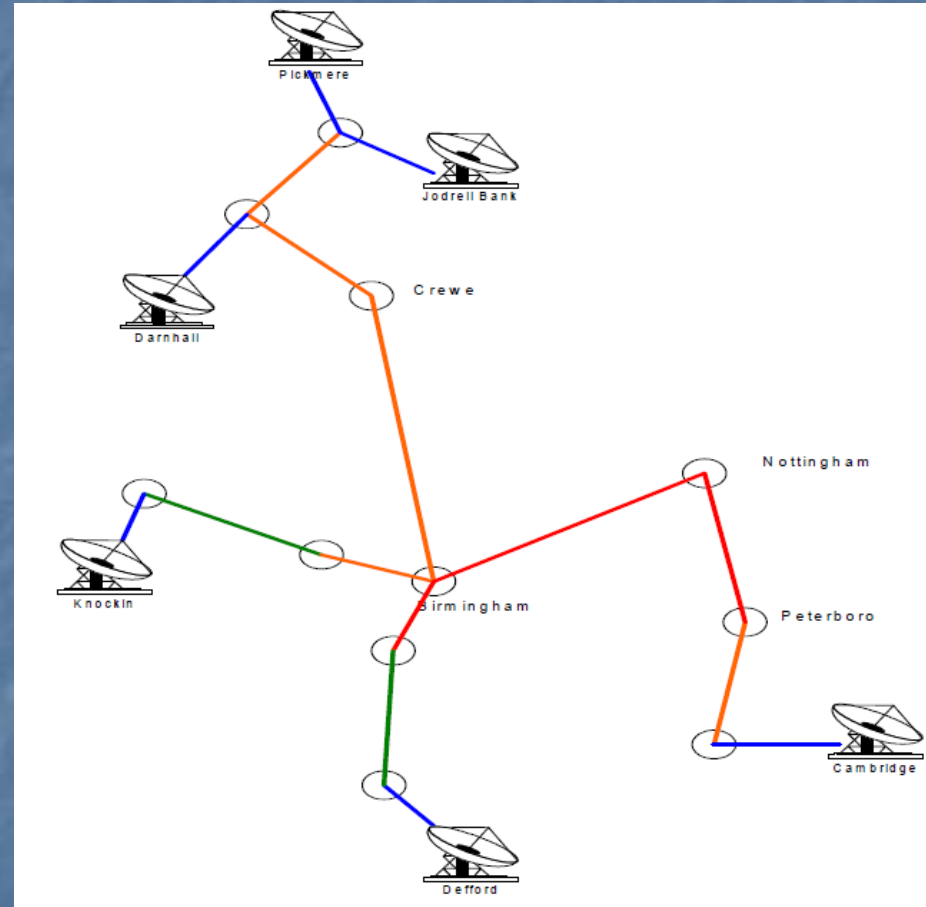

# e-Merlin Telescope Links

e-MERLIN – radio links replaced by leased dark optical fibres running beside major railway lines

Useable bandwidth increased from 15MHz/polzn to 2GHz/polzn  
(*cf »dial-up → cable broadband*)

Wide-band astronomy return links in place and under test

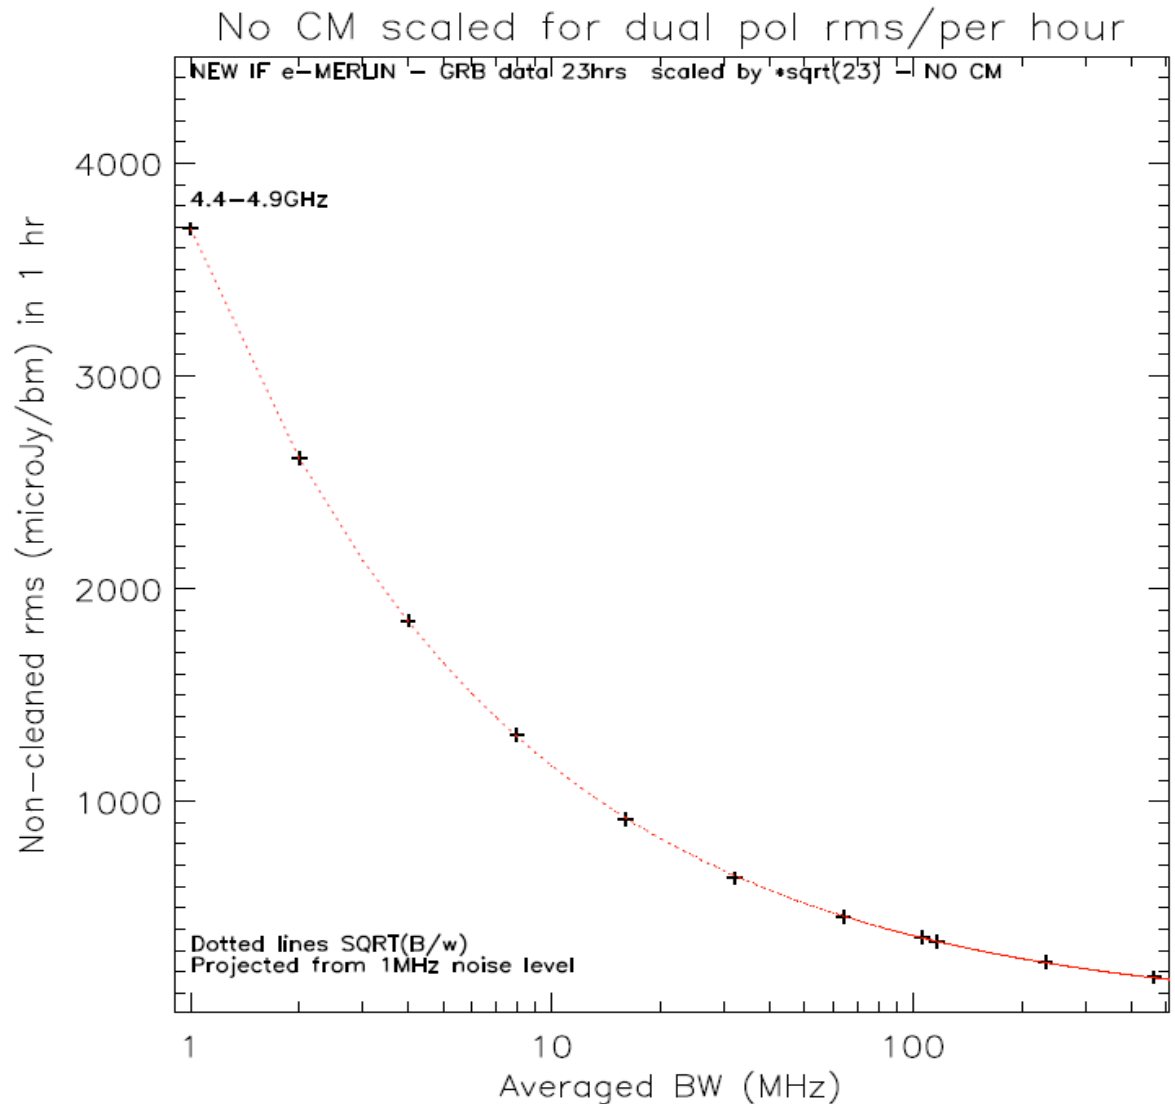

Coherence timing links to be removed from radio masts and implemented over optical fibre network  
– scheduled August-September 2011

# e-Merlin Sensitivity Tests (512MHz BW)

- Scales as  $\sqrt{BW}$
- Scales as  $\sqrt{\tau}$
- Noise  $\sim$ Gaussian
- As with EVLA some sensitivity issues being identified and optimised
- Polarization performance now being characterised

# e-MERLIN sensitivity

Sub-mas ICRF astrometry (in-beam calibration)

Full polarization, 512MHz continuum under test

Resolution matches HST/JWST, ALMA

VO access to customised archive products

Addition of 76m Lovell telescope improves sensitivity by  $\sim 2$

	L-band	C-band	K-band
<b>GHz/cm</b>	1.3-1.725/23-17.4	4.2-7.8/7.1-3.8	21.5-24.5/1.4-1.2
<b>Ang. resol'n</b>	220 - 110 mas	70 - 30 mas	13 - 8 mas
<b>FoV</b>	13 - 30 arcmin	4 - 7 arcmin	2 arcmin
<b>Continuum</b>	sensitivity/beam	sensitivity/beam	sensitivity/beam
$3\sigma$ 12 hr	14 $\mu$ Jy	6 $\mu$ Jy	15 $\mu$ Jy

# Spectral capability

High spectral resolution possible  $\delta v \geq 2$  Hz ( $\lambda/\delta\lambda \leq 7 \times 10^8$  @ 21cm)

- Multiple lines/high velocity sources in a single band
- Transfer calibration between lines and continuum
- Almost always a good, close calibrator

Optimal sensitivity even if line too weak to self-cal

Initial spectral configurations now under test

Flexible configurations – 16 independent sub-bands

- Use rest of band for high-sensitivity continuum
- Easy to match spectral configurations with EVLA or VLBI

Spectral	L-band	C-band	K-band
$3\sigma$ 12 hr	sensitivity/beam (per channel)	sensitivity/beam (per channel)	sensitivity/beam (per channel)
0.05 km/s	23 mJy	10 mJy	32 mJy
3 km/s	2.9 mJy	1.3 mJy	4 mJy

# *e*-MERLIN First Image – Double Quasar

Radio jet —

— Quasar A

- First gravitational lens (*Walsh et al 1979*)
- All 6 antennas incl. Cambridge
- Most sensitive high-res image
- 6 – 6.5 GHz, single pol.
  - 50-mas resolution
  - 13 $\mu$ Jy/bm rms

— Counter jet

Foreground galaxy —

— Quasar B

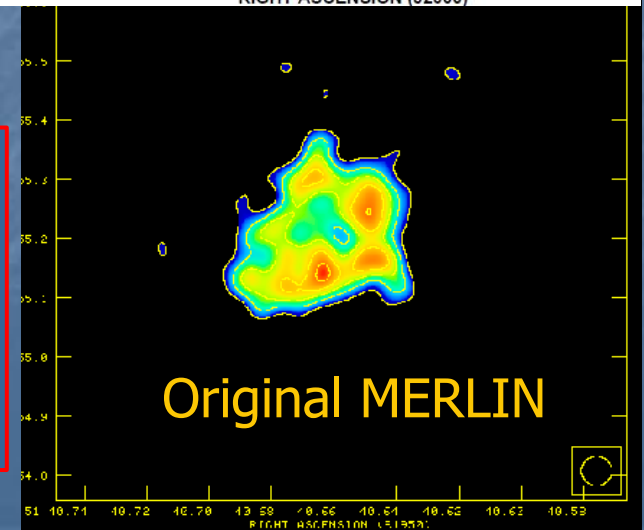

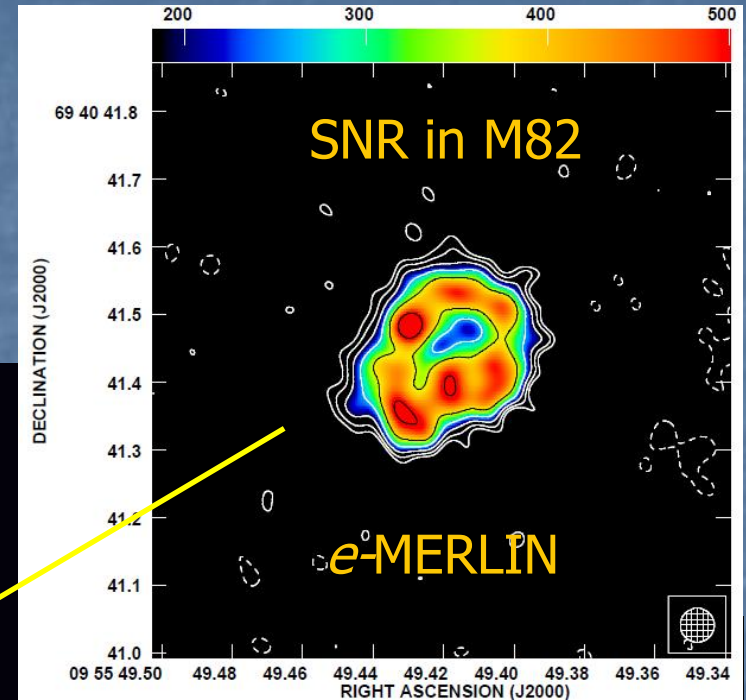

Time delay=417 days  
→  $H_0=64\text{km/s/Mpc}$

QSO	$z=1.41$
Galaxy	$z=0.355$

# More Test Images – M82

Even with only 512Mhz of the planned 2GHz of total bandwidth at C-Band, *e*-Merlin sensitivity *uv*-coverage and image fidelity is transformed.

*e*-Merlin C-Band image (right), resolution 35mas.  
VLA+MERLIN (below), resolution 120mas

Full operations at L & C-Band expected by end of calendar year 2011

PATT – Semester 2012A

# e-MERLIN and Star-formation Studies at High Redshift

Original study MERLIN+VLA – Muxlow et al 2005

10×10 arcmin field centred on the GOODS-N  
92 radio sources >40μJy. Data from ~1996

High resolution imaging can morphologically  
distinguish AGN & SF. Source sizes ~1.5''

Radio emission in the radio population is dominated  
by point-like star-forming galaxies typically from  
~13,000 z-band galaxies

# New Ultra-Deep Study of GOODS-N

A tiered *e*-MERLIN Legacy proposal – the *e*-MERGE Survey will study the formation and evolution of star-forming galaxies and AGN to redshifts  $> 5$

– The *e*-MERlin Galaxy Evolution Survey

- Tier 0 – *Imaging radio emission from normal galaxies out to  $z \sim 5$   
Deep imaging around clusters to utilise amplification by lensing*
- Tier 1 – *A very deep directed survey of the  $\mu$ Jy radio source population  
Deep imaging of the  $\mu$ Jy radio source population in GOODS-N*
- Tier 2 – *A reliable cosmic census of starburst and AGN populations  
Medium depth imaging over a number of fields (total area  $\sim 2$  sq. degrees)*

The combination of these tiers will ensure a full sampling of the active and star-forming galaxy radio luminosity function out to  $z \sim 5$

>60 CO-Is from 9 countries

Tier 0: Ian Smail [Durham]

Tier 1: Tom Muxlow [Manchester]

Tier 2: Ian McHardy [Southampton]

$\sim 2400$  hours of *e*-MERLIN time proposed – Tiers 0 & 1 approved

# Tier 1: New Ultra-Deep Study of GOODS-N

e-MERLIN+EVLA will exceed the depth of the existing MERLIN study in just 24 hours of on-source integration.

$\lambda$  20cm: Single pointing centre, 20 days including 76m Lovell telescope.

Central 10 arcminute field  $1\sigma \sim 500\text{nJy/beam}$

Outer 30 arcminute field  $1\sigma \sim 1\mu\text{Jy/beam}$

only

# Tier 1: New Ultra-Deep Study of GOODS-N

e-MERLIN will exceed the depth of the existing MERLIN combination map in just 24 hours of on-source integration.

$\lambda$  20cm : Single pointing centre, 20 full tracks.

Central 10 arcminute field  $1\sigma \sim 500\text{nJy}/\text{beam}$

Outer 30 arcminute field  $1\sigma \sim 1\mu\text{Jy}/\text{beam}$

e-MERLIN will image  $\sim 850$  individual starburst and AGN with an angular resolution of  $\sim 200$  mas, complete to  $\sim 3\mu\text{Jy}$

(**>10 times deeper than the original study**)

Surrounding 800 square arcmins,  $\sim 2500$  star-forming galaxies and  $\sim 1200$  AGN brighter than  $\sim 6\mu\text{Jy}$

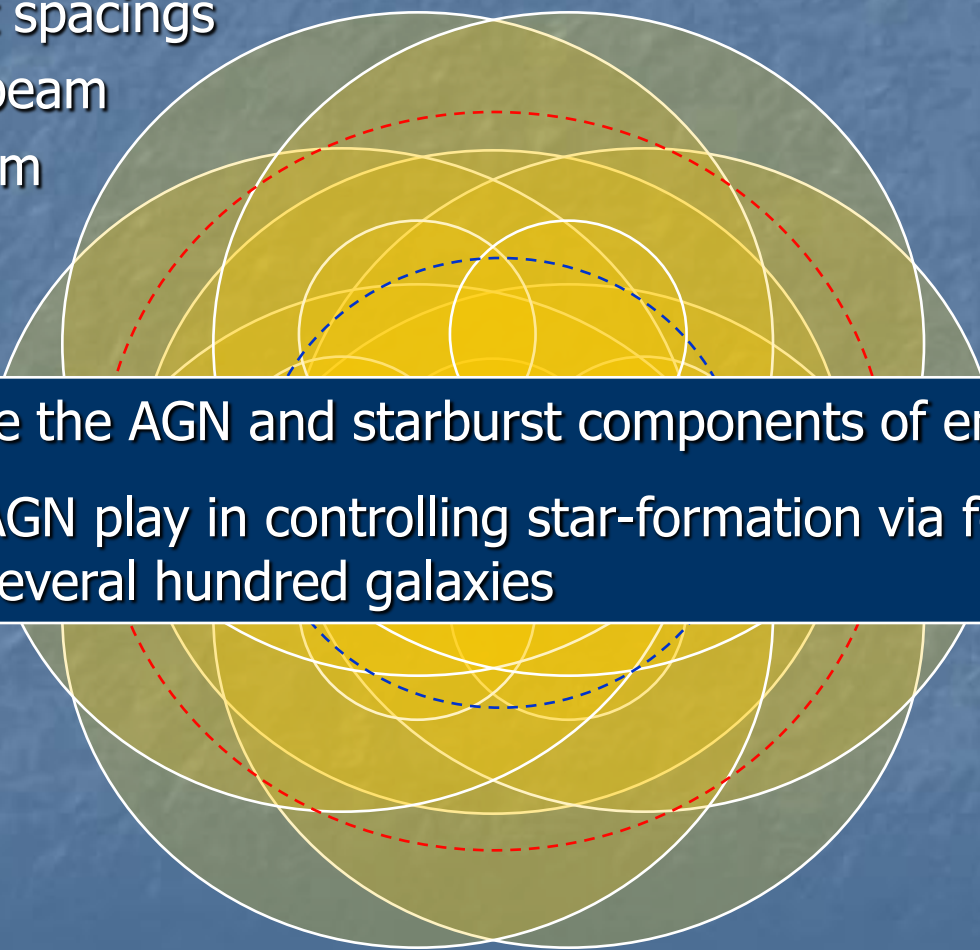

New ultra-deep  
 $\lambda$  6cm image

**5250:92 >50x increase in source numbers !!**

# Tier 1: New Ultra-Deep Study of GOODS-N

- New  $\lambda$  6cm image: 7 pointing centres each with 3 long tracks
- Mosaic pattern set for Lovell 3 arcminute beam
- EVLA will provide short spacings
- Inner 6'  $1\sigma \sim 500\text{nJy}/\text{beam}$
- 6-10'  $1\sigma \sim 700\text{nJy}/\text{beam}$
- Resolution 40 mas

Separate and disentangle the AGN and starburst components of emission  
Study the role that the AGN play in controlling star-formation via feedback  
- on sub-kpc scales for several hundred galaxies

# Tier 1: New Ultra-Deep Study of GOODS-N

Merging system  
with a dust lane

*e*-MERGE at 6cm  
will image this  
system at 40 mas  
+ EVN  $\rightarrow$  1mas

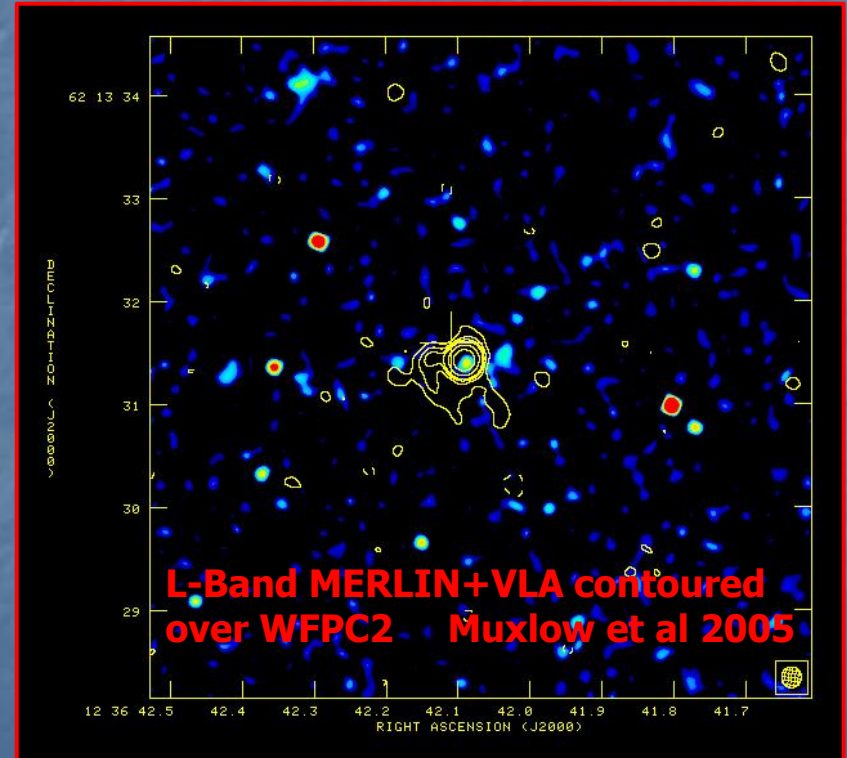

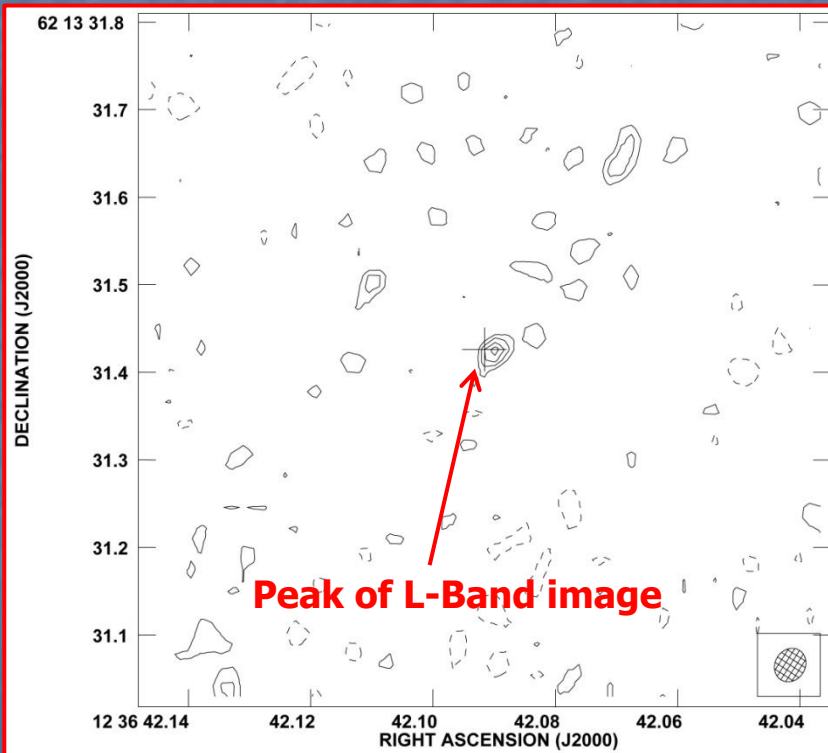

$\rightarrow$  detailed SF  
activity & role of  
any embedded  
AGN

# *e*-MERLIN GOODS-N Test Image

J123642+621331 is a composite AGN-Starburst system at a redshift of 4.424

The new *e*-MERLIN C-Band image (left, rms 13 $\mu$ Jy/bm) shows the detection of a faint flat-spectrum core component at the base of the jet confirming the composite nature of this system. **C-Band *e*-MERLIN is a fantastic AGN finder**

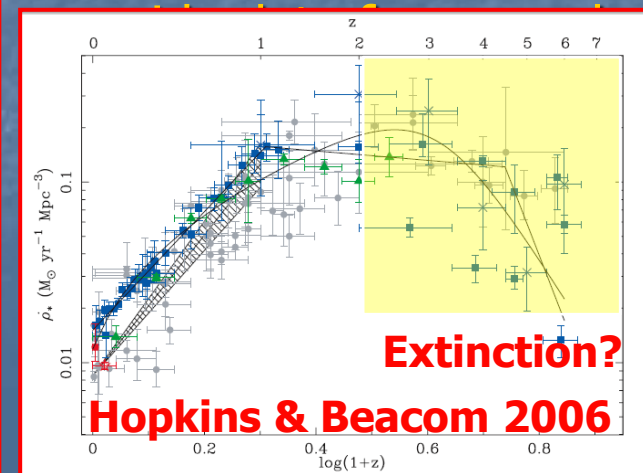

# Star-formation History of the Universe

## - from Extinction-free Starburst Radio Luminosities

The co-moving Star-Formation Rate Density of the Universe from L-Band radio studies by Seymour et al (2008), Haarsma et al (2000), & UV, H $\alpha$ , Far-IR... Hopkins (2004)

L-Band results from the e-MERGE survey will

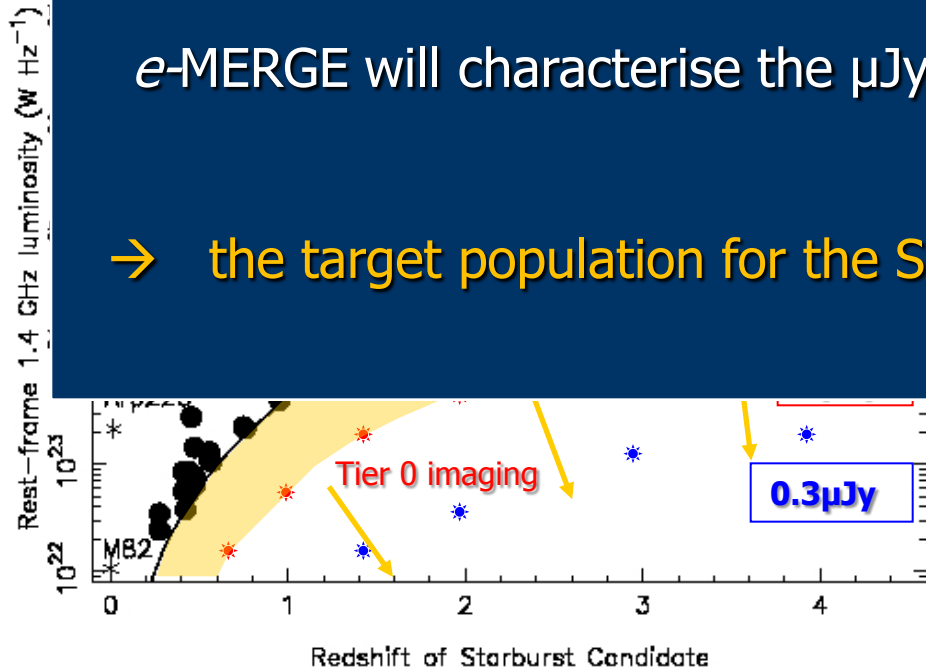

# Tier 0: Imaging sub- $1\mu\text{Jy}$ galaxies

A single  
180-hr L-band  
pointing on  
strong lensing  
cluster A2218  
( $z=0.18$ ).

$e$ -MERGE will characterise the  $\mu\text{Jy}$  & sub- $\mu\text{Jy}$  radio source population

→ the target population for the SKA in future high redshift SF studies

300 nJy

Measure faint radio counts  
May include SF galaxies with  
 $\text{SFR} \sim 200 M_{\odot}/\text{yr}$  to  $z \sim 5$

# The New Generation of Imaging Arrays

**Extragalactic Star-formation:**  
(a very vestigial description)

**EVLA:**  
Deep, wide  $\mu\text{Jy}$  source surveys at  
 $\sim 2$  arcsec resolution

**e-MERLIN:**  
Detailed imaging of nearby &  
distant star-forming galaxies  
Deep, narrow  $\mu\text{Jy}$  source surveys  
at  $\sim 0.1$  arcsec resolution

**EVN+:**  
Ultra-high resolution imaging of  
S<sub>ne</sub>/SNR in nearby galaxies and  
star-forming regions in high  
redshift systems

The dawn of a transformative era with  
massively improved imaging capability  
with the potential of studying a  
substantial proportion of the galaxy  
population to high redshifts

Major multi-wavelength studies of  
several equatorial fields

...and SKA still to come...!!

**ALMA:**  
Early Science – detailed imaging of  
molecular gas dynamics in nearby  
galaxies  
Full Operations – extensive detailed  
imaging of molecular gas dynamics in  
high redshift galaxies
