

LOOKING AT THE UNIVERSE

DR. KAREN MASTERS

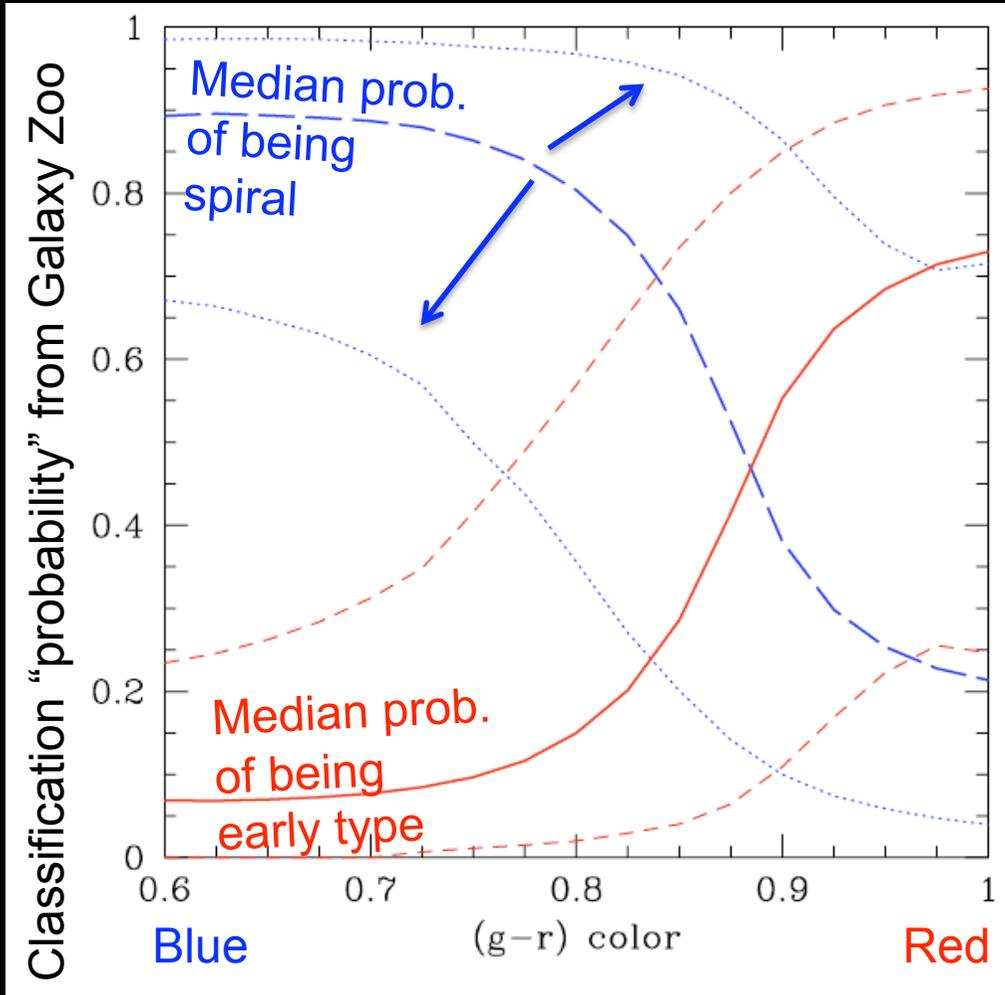

LEVERHULME EARLY CAREER FELLOW

ICG, UNIVERSITY OF PORTSMOUTH

Why Look – galaxies aren't all the same...

Morphology \neq Colour

Colour and morphology are correlated, but not equivalent

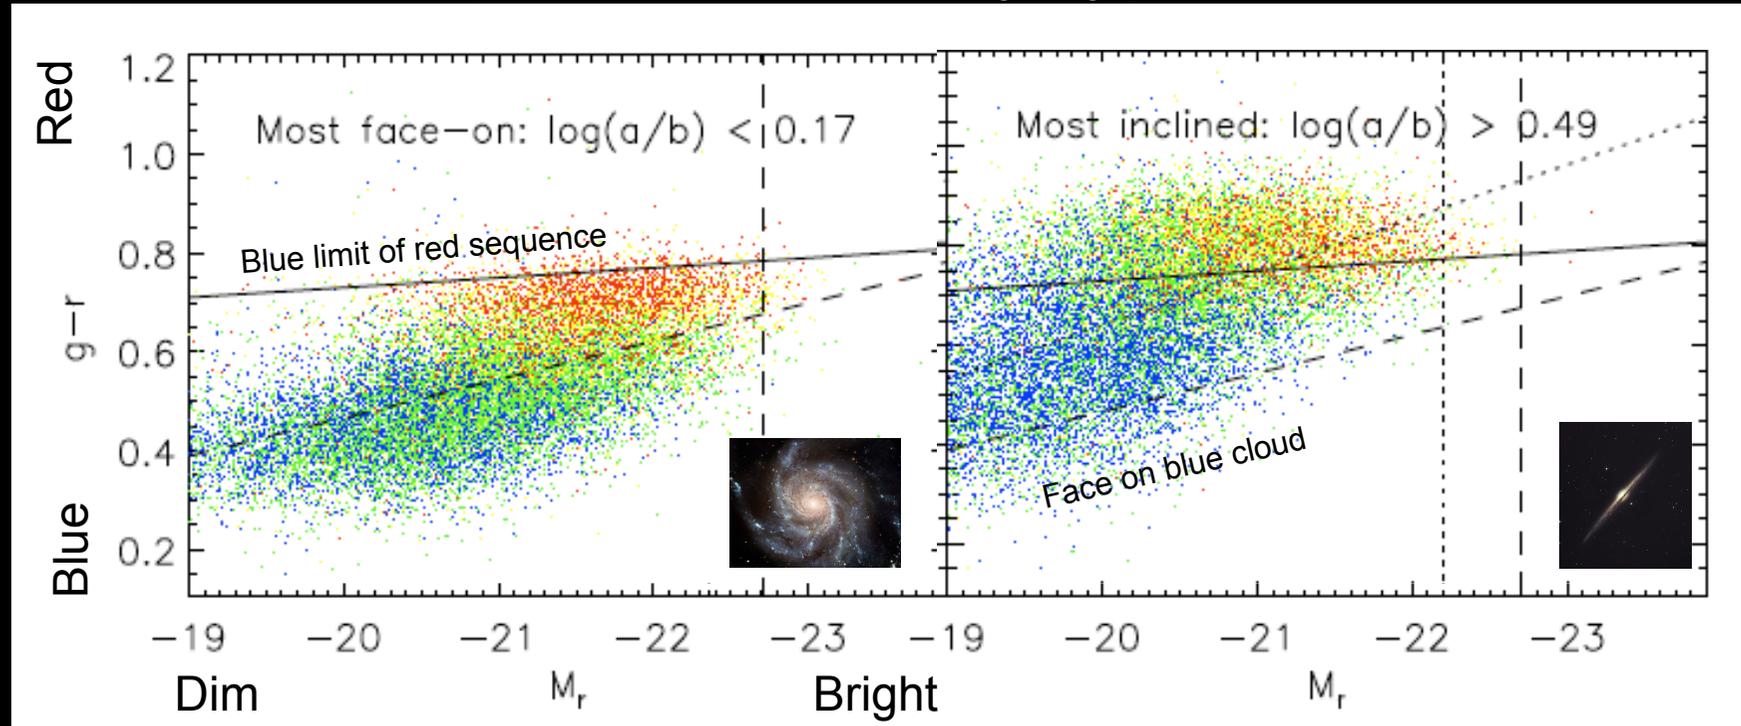

Colour = star formation history

Morphology = dynamical history

		DYNAMICAL HISTORY	
		BULGE (EARLY)	DISK (SPIRAL)
SF HISTORY	RED		
	BLUE		

Skibba et al. 2009 (Colour, morphology and environment)

Dust makes edge on spirals masquerade as early-types

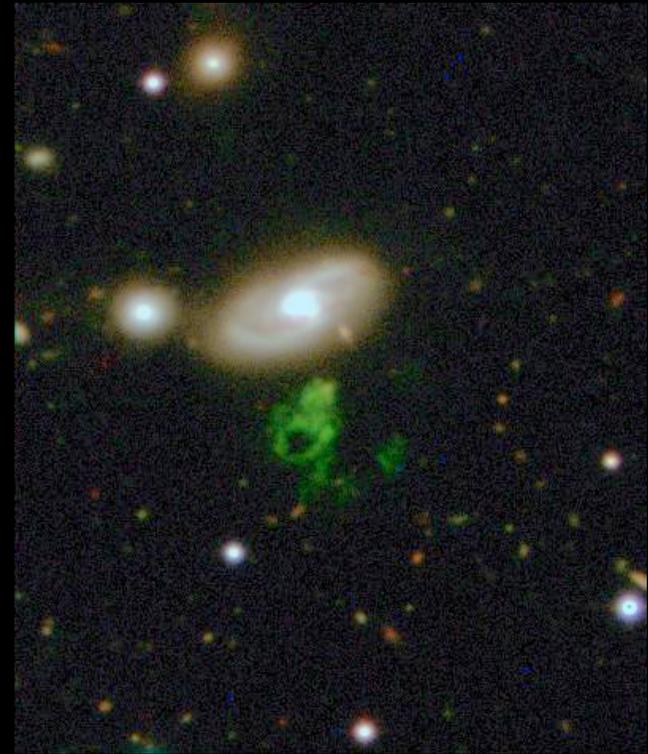

Masters et al. 2010a (MNRAS 404, 792) – Galaxy Zoo: Dust in Spirals

Dust reddens and dims inclined spirals

- they are missing from volume limited samples
- they masquerade as early types in colour (and concentration) selected samples
- at the very least use a shape cut...

You never know what you'll find...

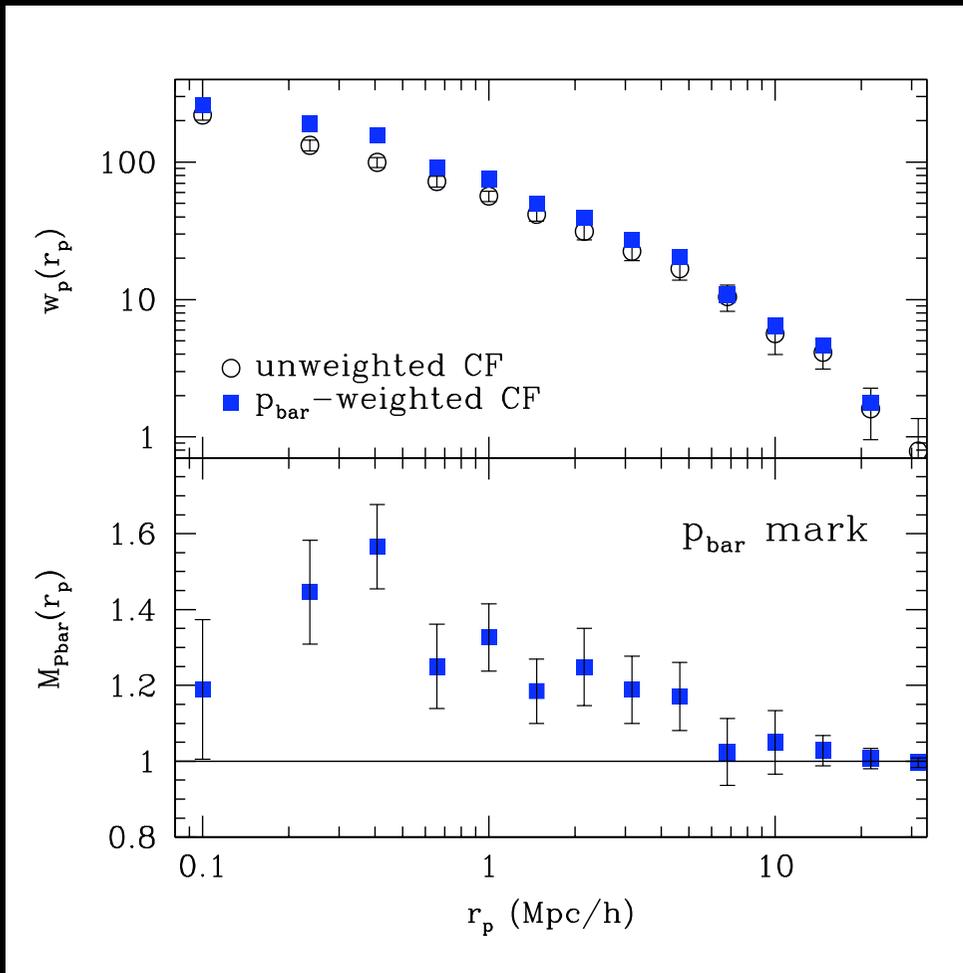

A quasar which has recently turned off....

“Hanny’s Voorwerp”

So what....?

Cosmological measurements getting so precise that systematics are becoming most important source of error. For example:

- Ross et al. 2012 – stars in our Galaxy affecting large scale angular correlation functions
- Skibba et al. 2012 – barred spirals cluster differently to unbarred spirals

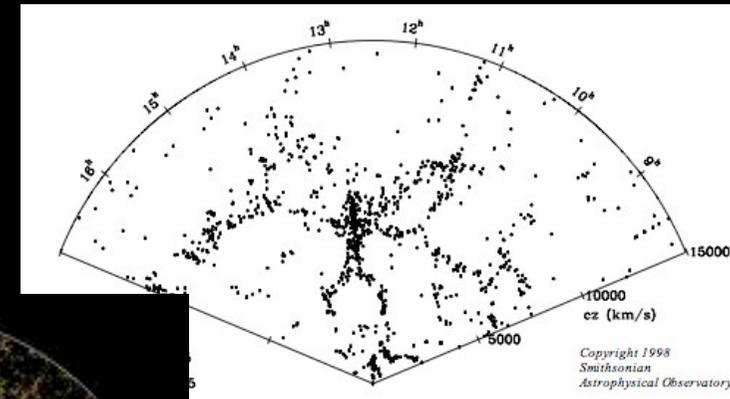

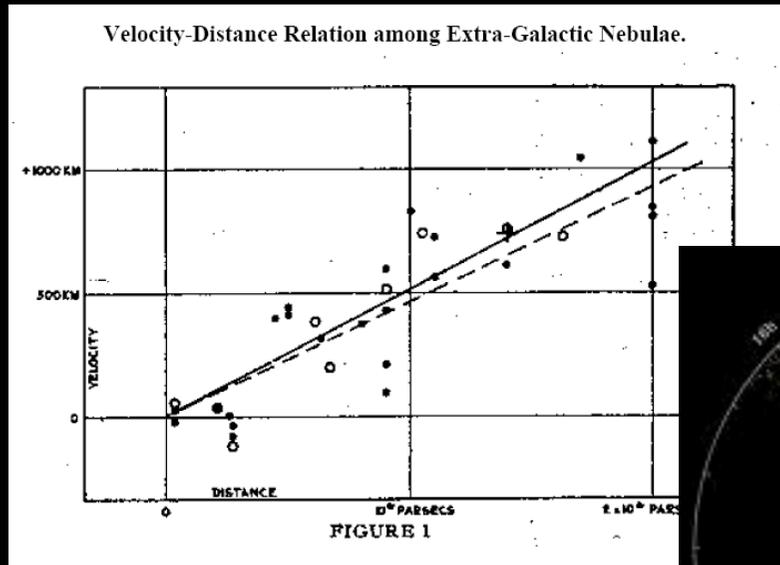

How Many Galaxies Are There?

1929: Edwin Hubble discovers expansion of the Universe (24 galaxies)

57 years

x 50

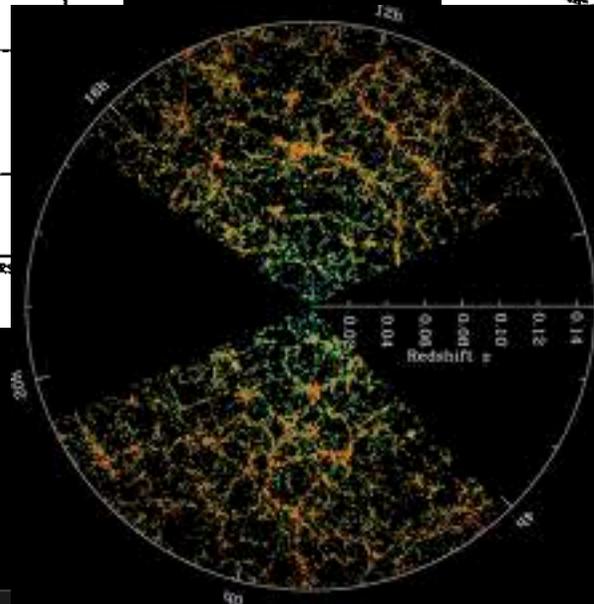

1986: CfA redshift survey - discovery of large scale structure (1100 galaxies; Huchra & Geller)

22 years

x 1000

2008: Final release of SDSS Main Galaxy Sample (1 million galaxies)

How to Take Part - Tutorial

How to look at a million galaxies – ask for help!

Your job is very simple! All you need to do is look out for the features that mark out spiral and elliptical galaxies. In fact, as you're a human and not a computer, most galaxies should be easy to classify since they're obviously spirals or obviously ellipticals. On this page, you will practice classifying galaxies. On the next page, you will take a short trial to test your skills. If you don't pass the trial, you can try again. Once you pass the trial, you can start contributing to Galaxy Zoo science!

Part 1A ... Spiral or Elliptical Galaxies?

This is a face-on **Spiral Galaxy**. You can clearly see the spiral arms and a central bulge.

This **Elliptical Galaxy** is composed entirely of a bulge of stars. There is no disk or spiral arms.

in one slide...

One of the most popular citizen scientist projects – 200,000+ contributors, and inspired the 600,000+ strong “Zooniverse” – which requires science to be central to all projects.

Surveys of contributors suggest they mostly do this out of a desire to help with science – science results are vital to success.

Visual classifications for SDSS galaxies (and now also HST surveys).

Classifications by **multiple independent citizen scientists** = extremely reliable, and not easy to fool (ie. a bar is a bar).

30+ peer reviewed papers using Galaxy Zoo classifications.

Phase 1 data is public (1 million MGS galaxies spiral or early-type).
Lintott et al. (2011); www.data.galaxyzoo.org

Why Do People Do This?

Galaxy Zoo: Exploring the Motivations of Citizen Scientists. (Raddick et al. 2009 astro-ph/0909.2925)

Motivation All Female Male Description (used in survey)

Motivation	All	Female	Male	Description (used in survey)
Contribute	40%	37%	41%	I am excited to contribute to original scientific research.
Astronomy	13%	10%	13%	I am interested in astronomy.
Discovery	11%	10%	11%	I can look at galaxies that few people have seen before.
Beauty	9%	12%	8%	I enjoy looking at galaxies.
Vastness	8%	10%	8%	I am amazed by the vast scale of the universe.
Science	7%	5%	7%	I am interested in science.
Zoo	4%	5%	4%	I am interested in the Galaxy Zoo project.
Help	3%	3%	3%	I am happy to help.
Fun	3%	5%	2%	I had a lot of fun categorizing the galaxies.
Learning	2%	1%	2%	I find the site and forums helpful in learning about astronomy.
Teaching	1%	1%	1%	I find Galaxy Zoo to be a useful resource for teaching others.
Community	0%	0%	0%	I can meet other people with similar interests.

Galaxy Zoo doesn't work unless the volunteers see scientific results coming out.

Pushing to higher redshift from the Ground...

SDSS3 Project – Baryon
Oscillation Spectroscopic
Survey

1.4 million galaxies... **BUT**

BOSS galaxies have median
size: 1.5"
(median SDSS3 seeing 1.1")

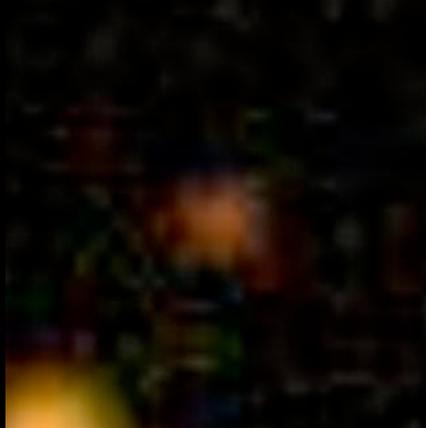

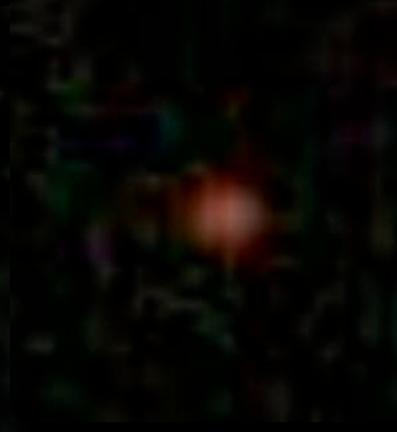

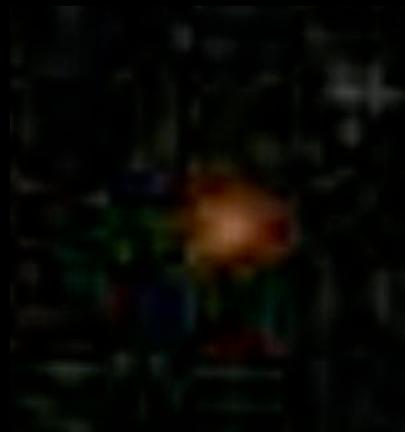

Star-galaxy separation is
becoming critical

All galaxies look like fuzzy
blobs...

but 240 are in COSMOS
field.....

SDSS Images of BOSS galaxies

15"

2" diameter fibre

HST Images - 74% Early types

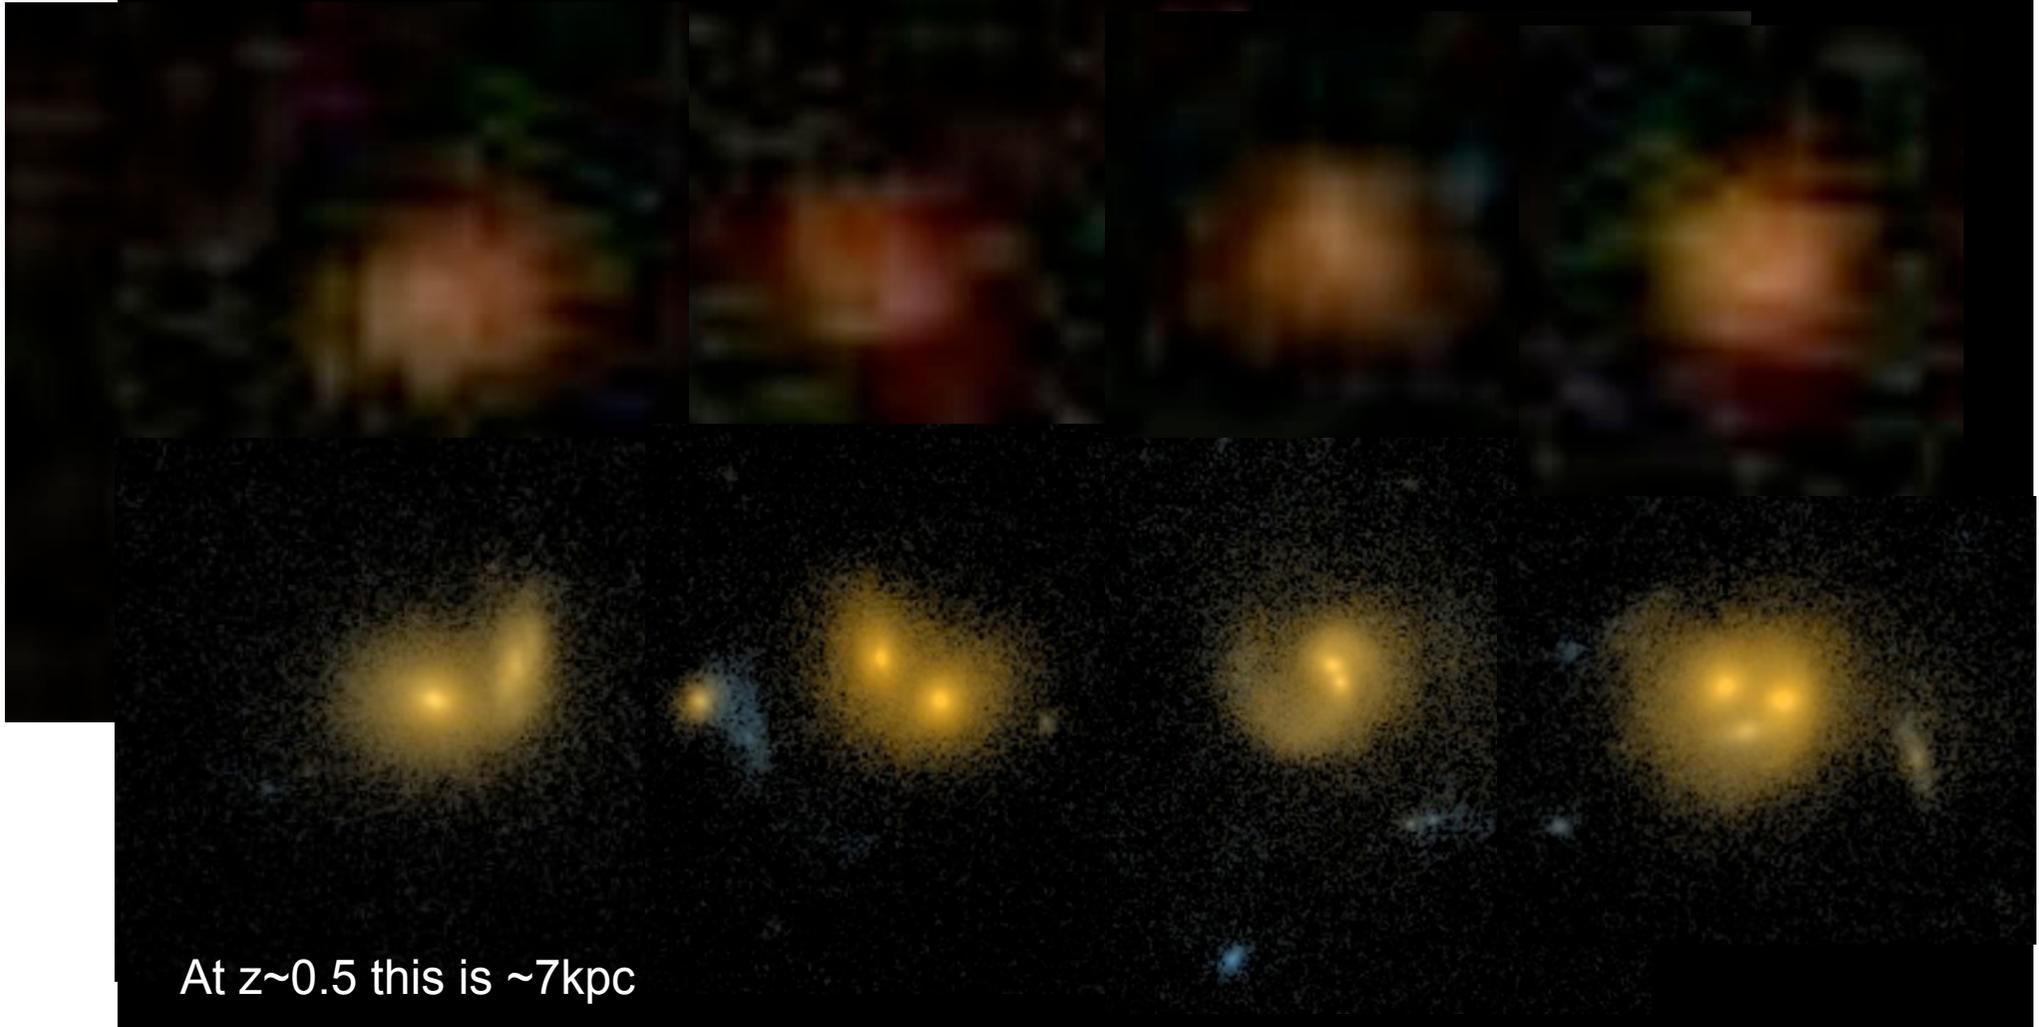

All HST colour composites are those made for
Galaxy Zoo: Hubble (IDs by me)

Masters et al. 2011 (MNRAS 418, 1055)

○ 2" diameter fibre

15 % of the early types are multiples within
the SDSS PSF (1.1" for DR8)

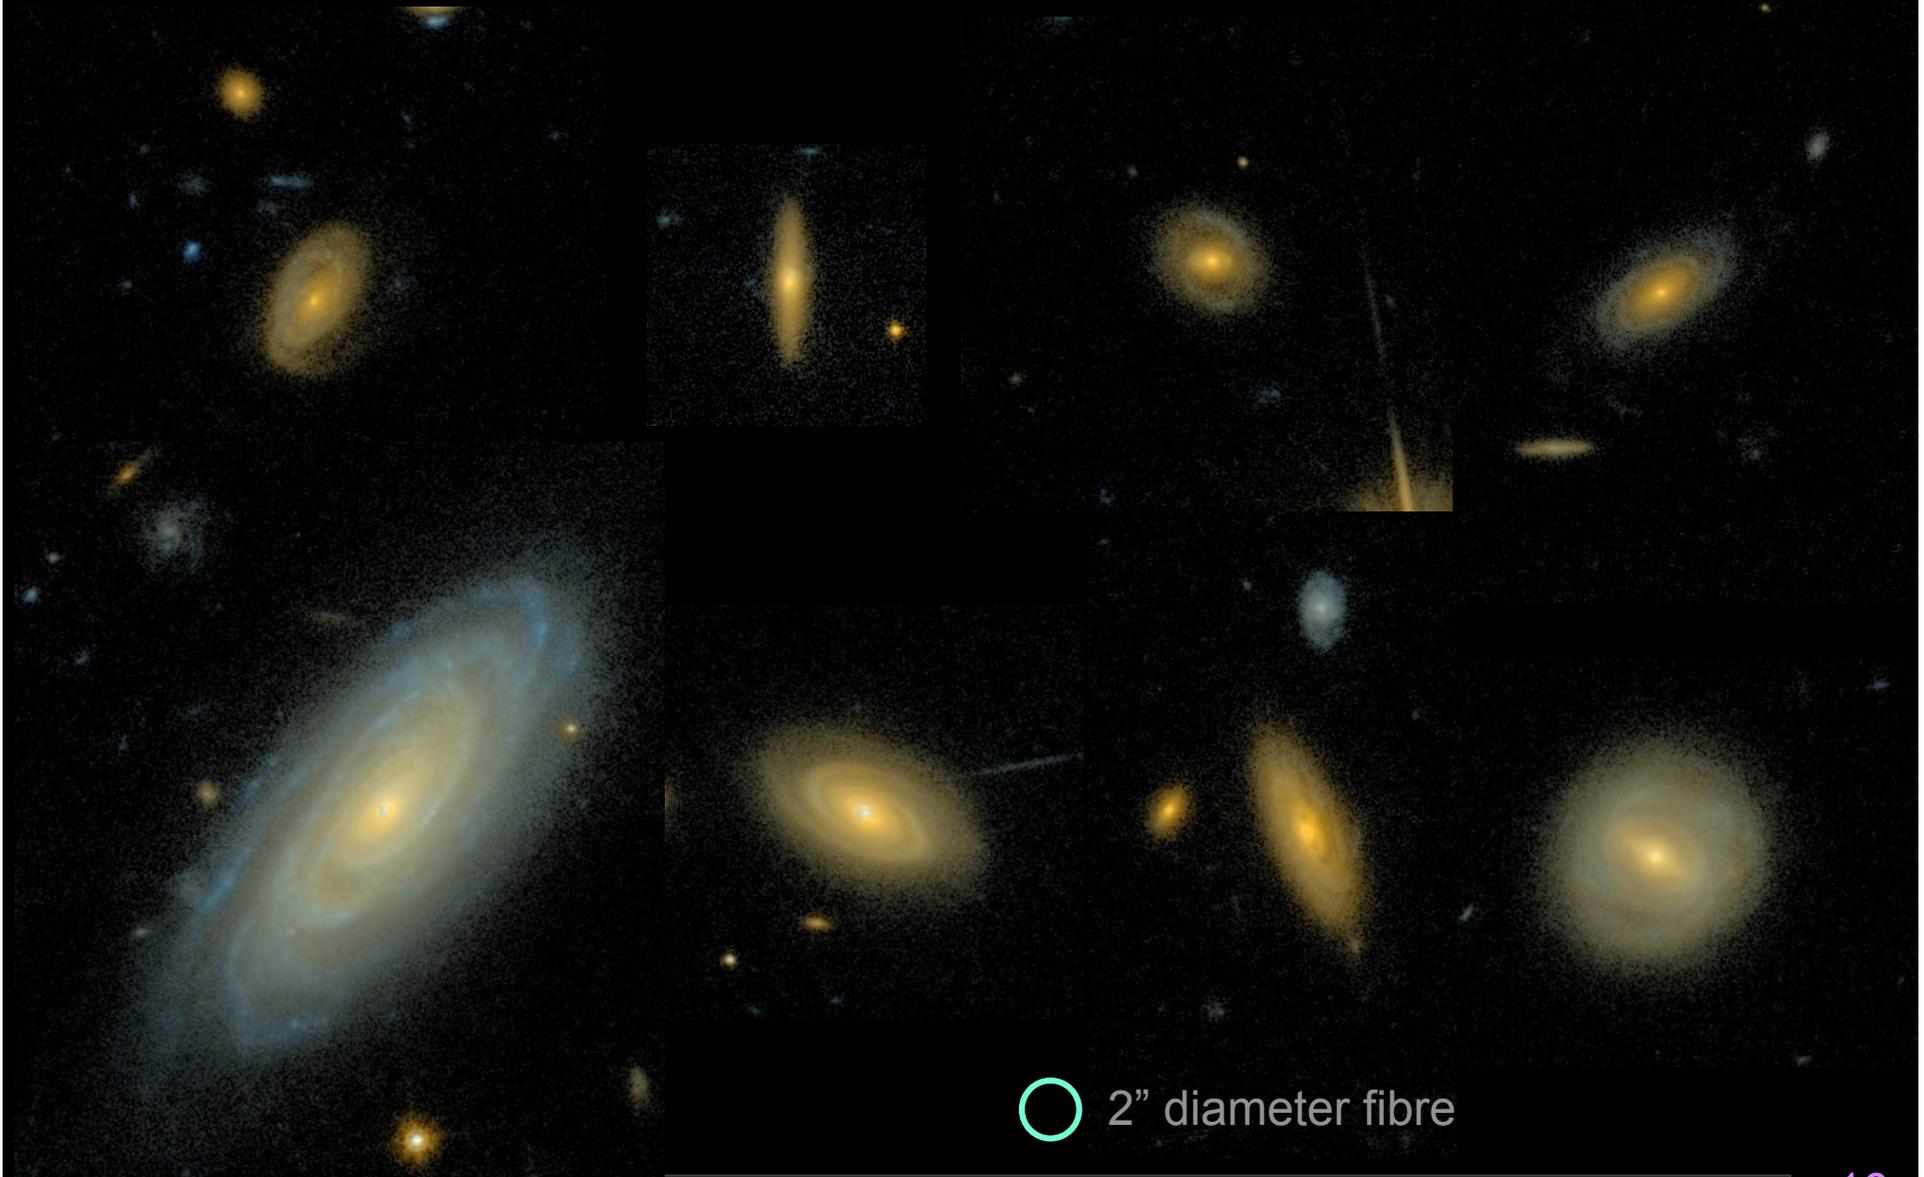

At $z \sim 0.5$ this is ~ 7 kpc

More SDSS Images of BOSS galaxies

○ 2" diameter fibre

HST Images - 24% Late types

○ 2" diameter fibre

- Not all galaxies are the same (red \neq early type)
- You should/will care about this:
 - when you find systematic effects (e.g. Ross et al. 2012, Skibba et al. 2012)
 - when simulations start including it
- Galaxy Zoo provides reliable morphologies for statistically interesting sample sizes
- Galaxy Zoo/Zooniverse projects only work when based on scientific goals/needs
- Pushing to high redshift from the ground makes all galaxies look the same (fuzzy blobs)
 - But that doesn't mean they are all the same (Masters et al. 2011)
