Subhaloes going Notts

Julian Onions – University of Nottingham

With Frazer Pearce, Alex Knebe, Stuart Muldrew,
Hanni Lux, Steffen Knollmann, et al.

What is it?

- Comparison of substructure detection in a Milky Way sized object.
- Follow on from “Haloes going Mad”.

Why do it?

- Dark matter detection via annihilation.
- Lensing via substructure.
- Many large, single halo simulations each with own subhalo detector: are these comparable?

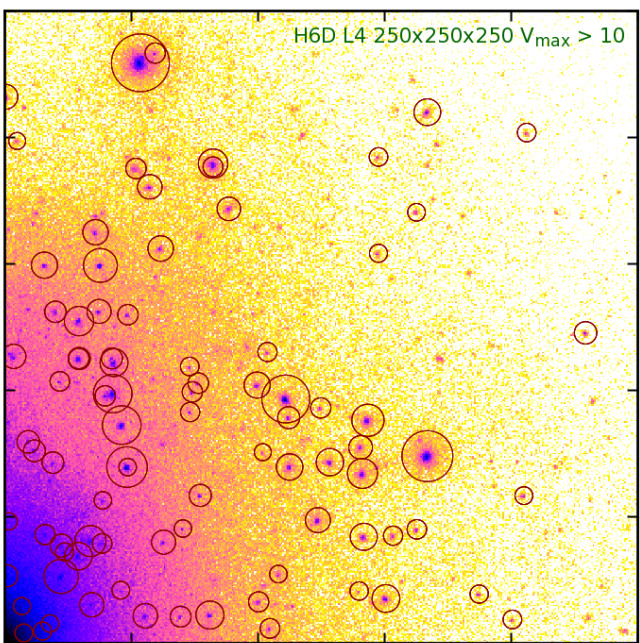

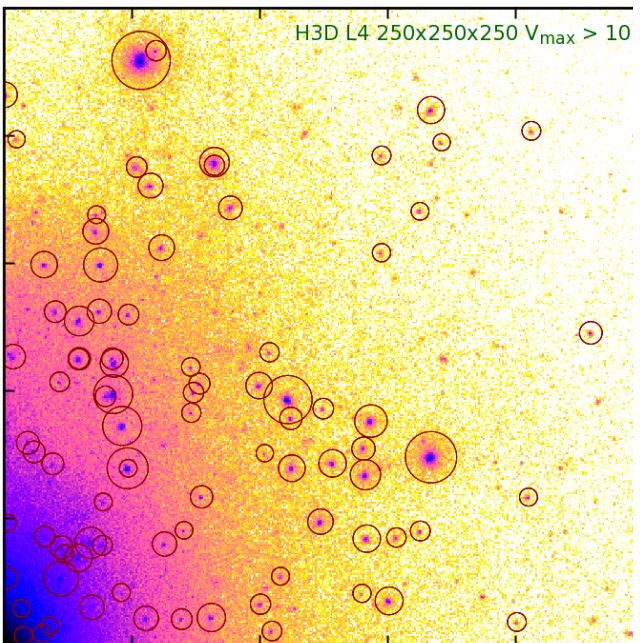

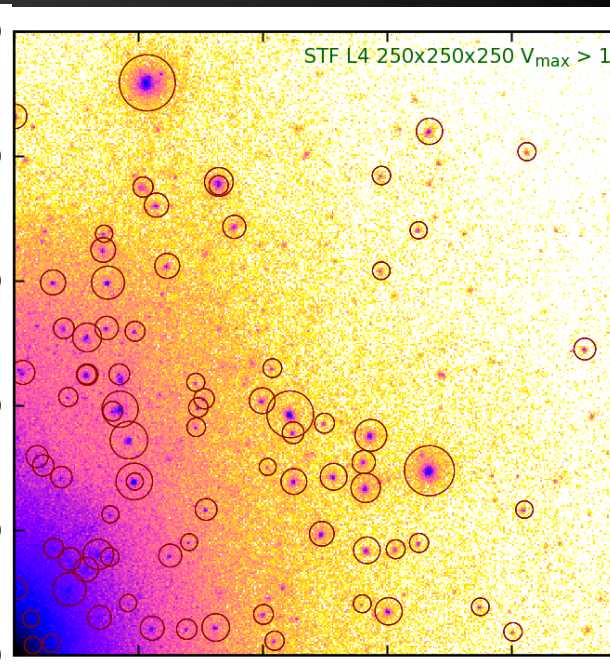

300 kpc/h

Finder	Contact	Method	Level
Adaptahop	Dylan Tweed	3-space particle	4
AHF	Alex Knebe	Adaptive mesh	1
HBT	Jiaxin Han	3-space+tracker	2
HOT3D	Yago Ascasibar	3-space particle	4
HOT6D	Yago Ascasibar	Phase space	4
HSF	Michal Maciejewski	Phase space	2
Mendieta	Andres Ruiz	3-space particle	3
Rockstar	Peter Behroozi	Phase space	1
STF	Pascal Elahi	Velocity/Phase space	3
Subfind	Volker Springel	3-space particle	1
Voboz	Mark Neyrinck	Voronoi	3

Common Processing

- Pipeline
 - Assign duplicates to smallest halo
 - refine centre of mass iteratively based on 50%
 - Process up to M_{200}
 - Calculate statistics

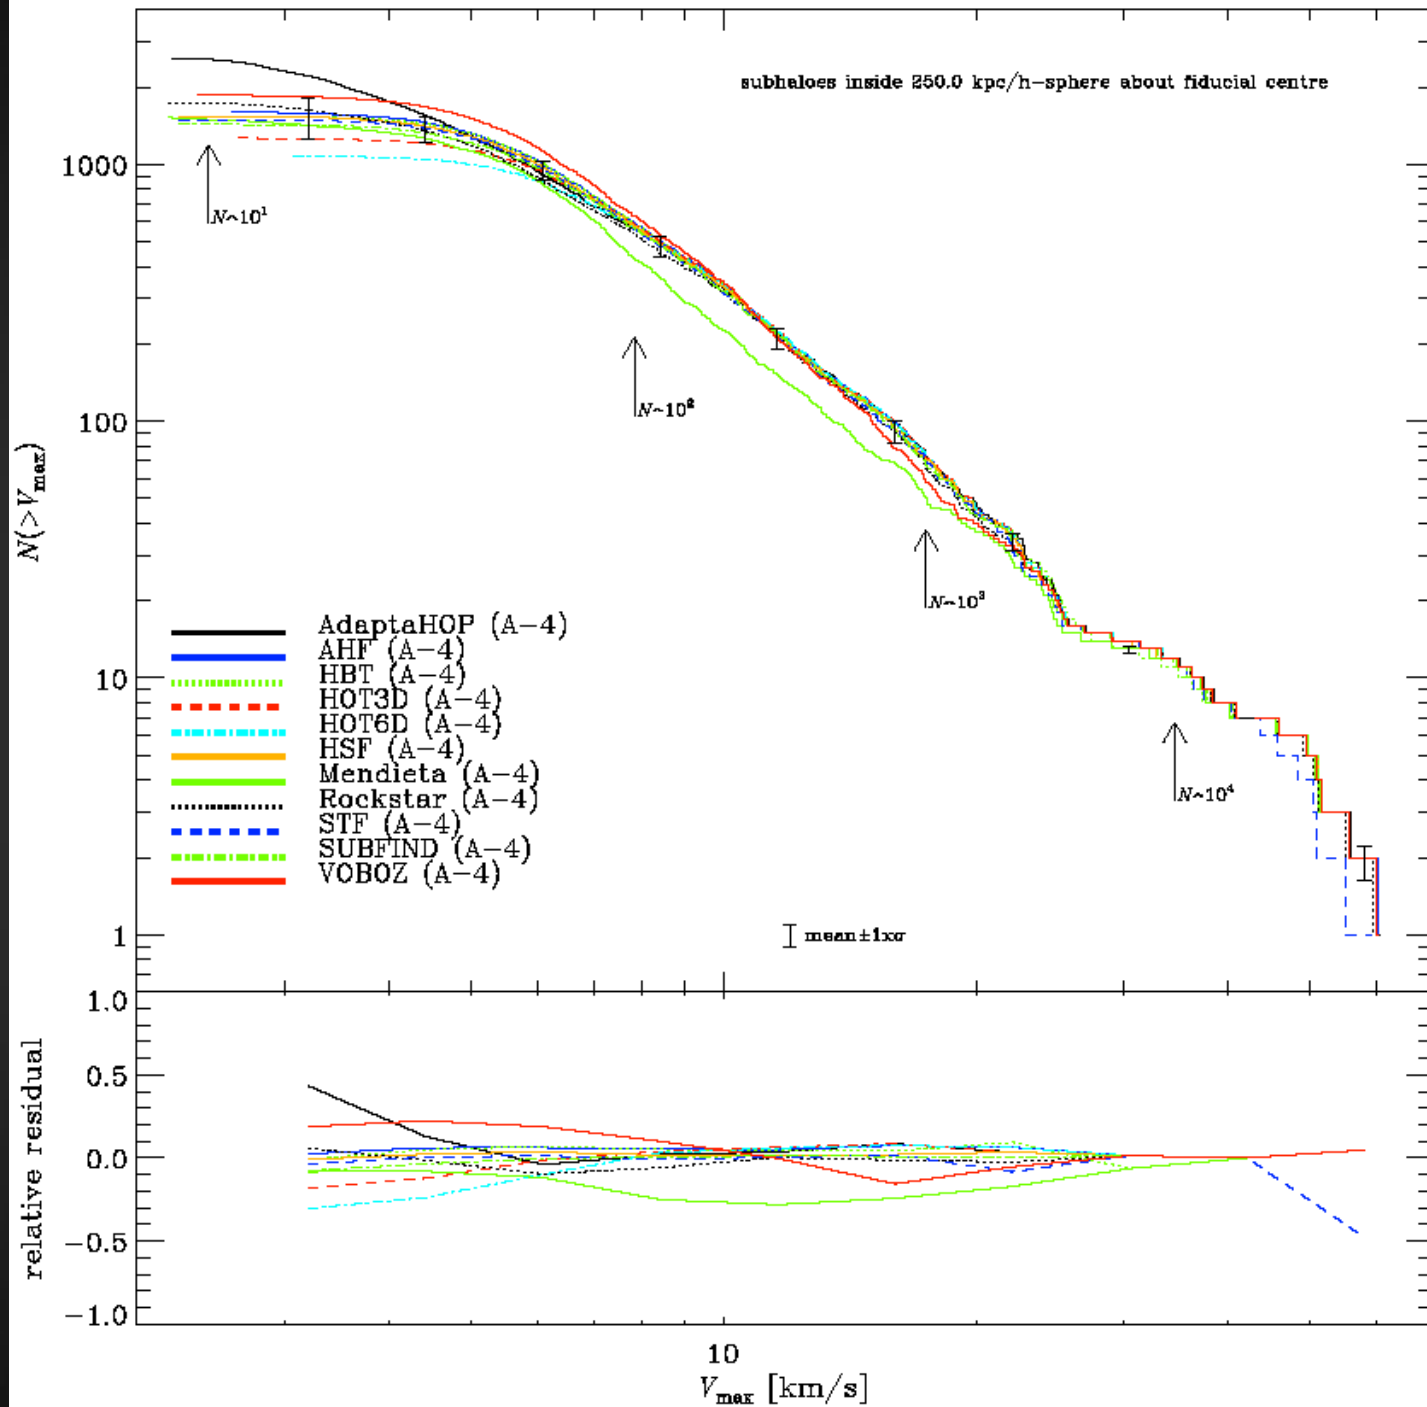

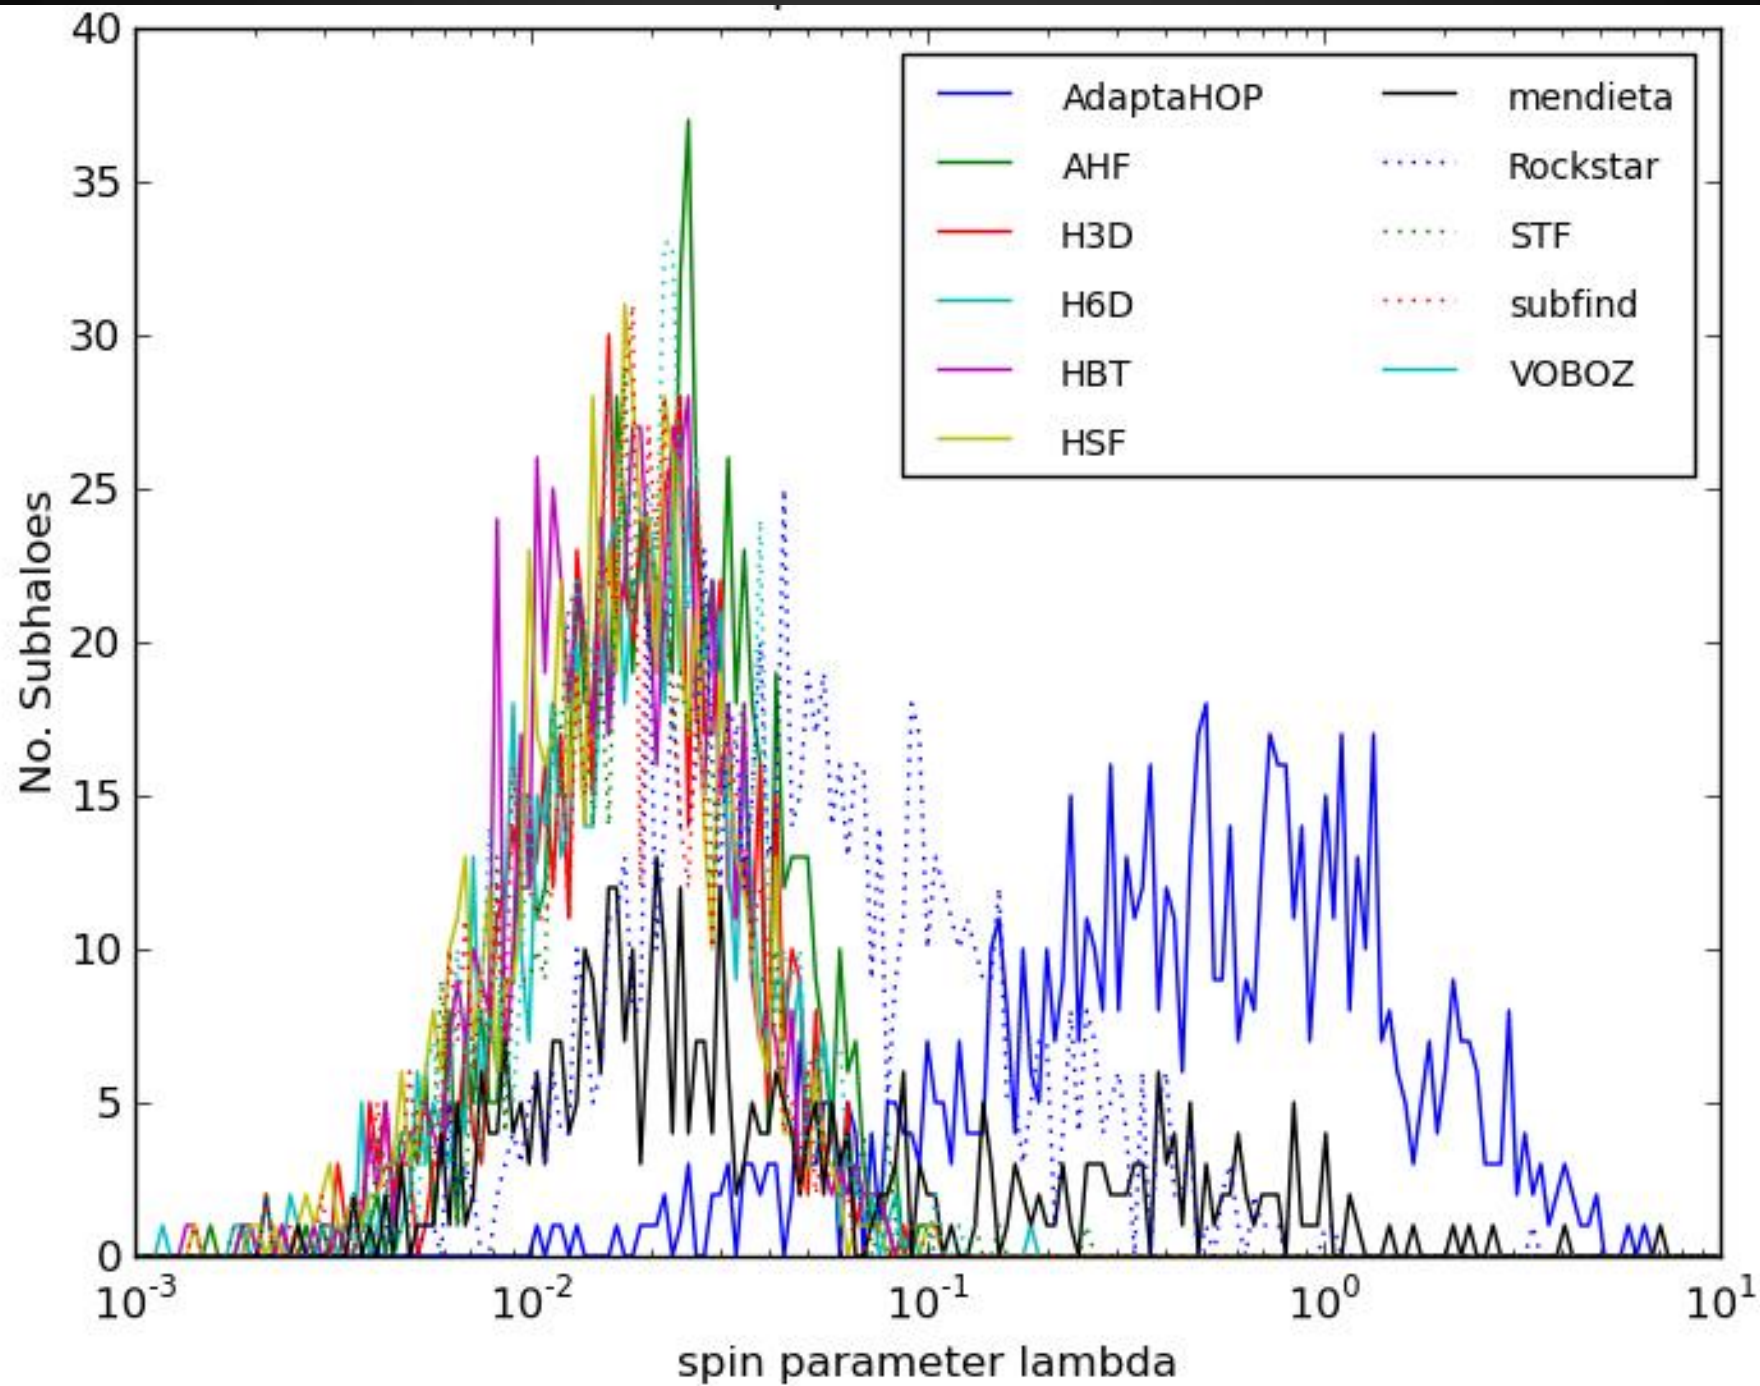

Conclusions

- Several reliable, efficient subhalo finders exist
- For recovering surviving clumps, phase space finders indistinguishable from real space finders
- Important to use unbinding
- Good to about 10% accuracy.

To be done:

- Compare finders own subhalo properties
- Uniform subhalo definition?

SubHaloes Going Notts
