

# Extended Star Clusters: Nature or Nurture?

Mark Gieles (Institute of Astronomy, Cambridge)

Jorge Peñarrubia (Instituto de Astrofísica de Andalucía, Granada)

Florent Renaud (Saclay, Paris)

NAM, Manchester, March 30, 2012

**47 Tuc** :  $M \simeq 10^6 M_{\odot}$

$$\rho_h \simeq 10^4 M_{\odot} \text{ pc}^{-3}$$

**NGC 7492** :  $M \simeq 10^4 M_{\odot}$

$$\rho_h \simeq 1 M_{\odot} \text{ pc}^{-3}$$

## Extended Star Clusters: Nature or Nurture?

Mark Gieles (Institute of Astronomy, Cambridge)

Jorge Peñarrubia (Instituto de Astrofísica de Andalucía, Granada)

Florent Renaud (Saclay, Paris)

“Faint fuzzy” and “extended” clusters

Fainter/fuzzier/more extended than ... ?

Scenarios

# “Faint fuzzy” and “extended” clusters

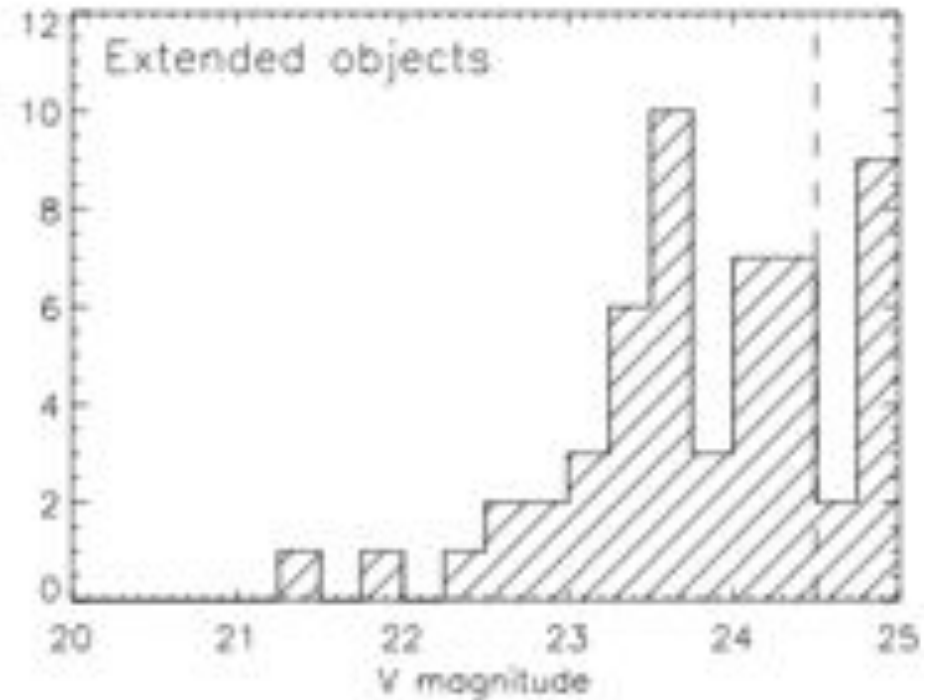

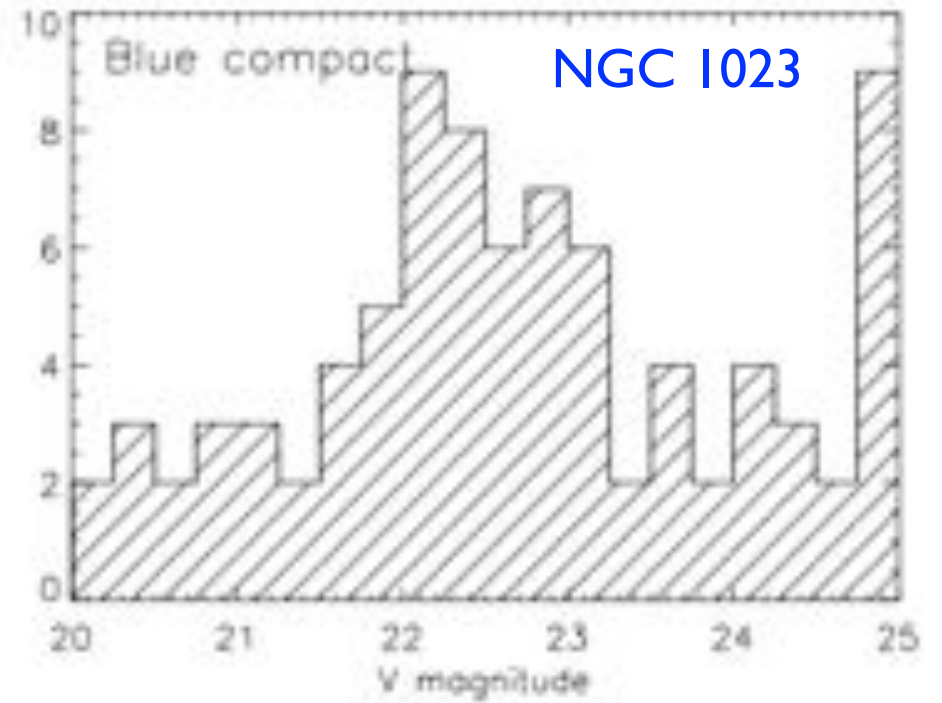

Fainter/fuzzier/more extended than ... ?

Scenarios

# “Faint fuzzy” star clusters

large:  $r_{\text{eff}} \approx 7$  pc

faint:  $M_V \approx -6$

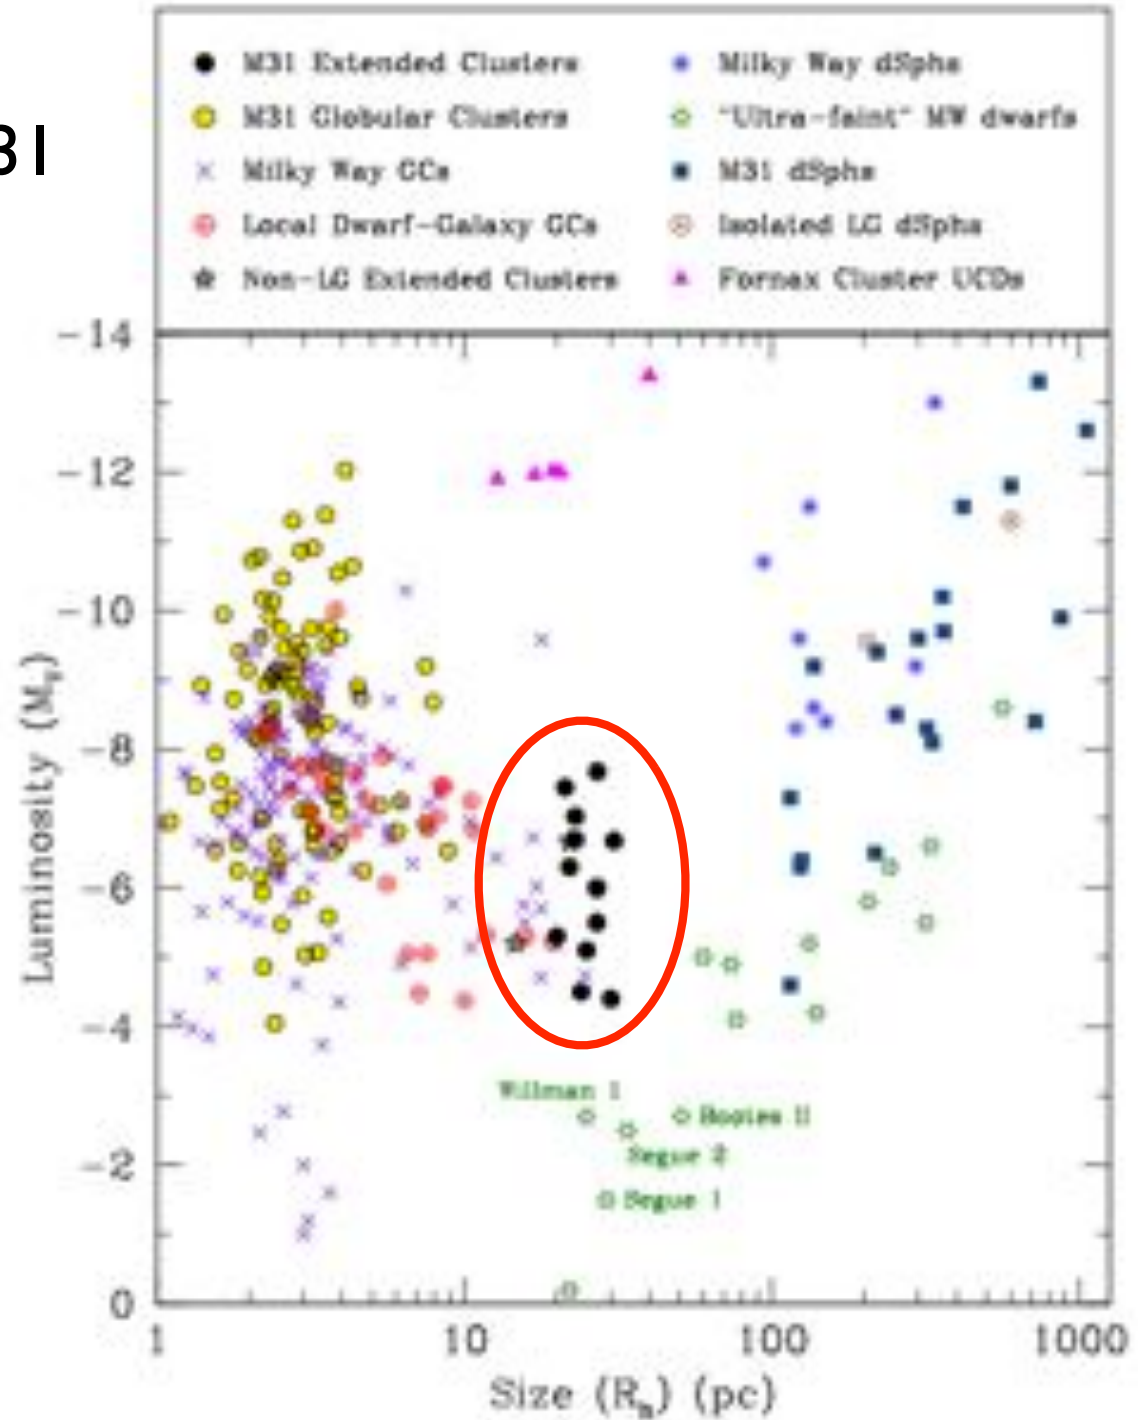

Larsen & Brodie (2000)

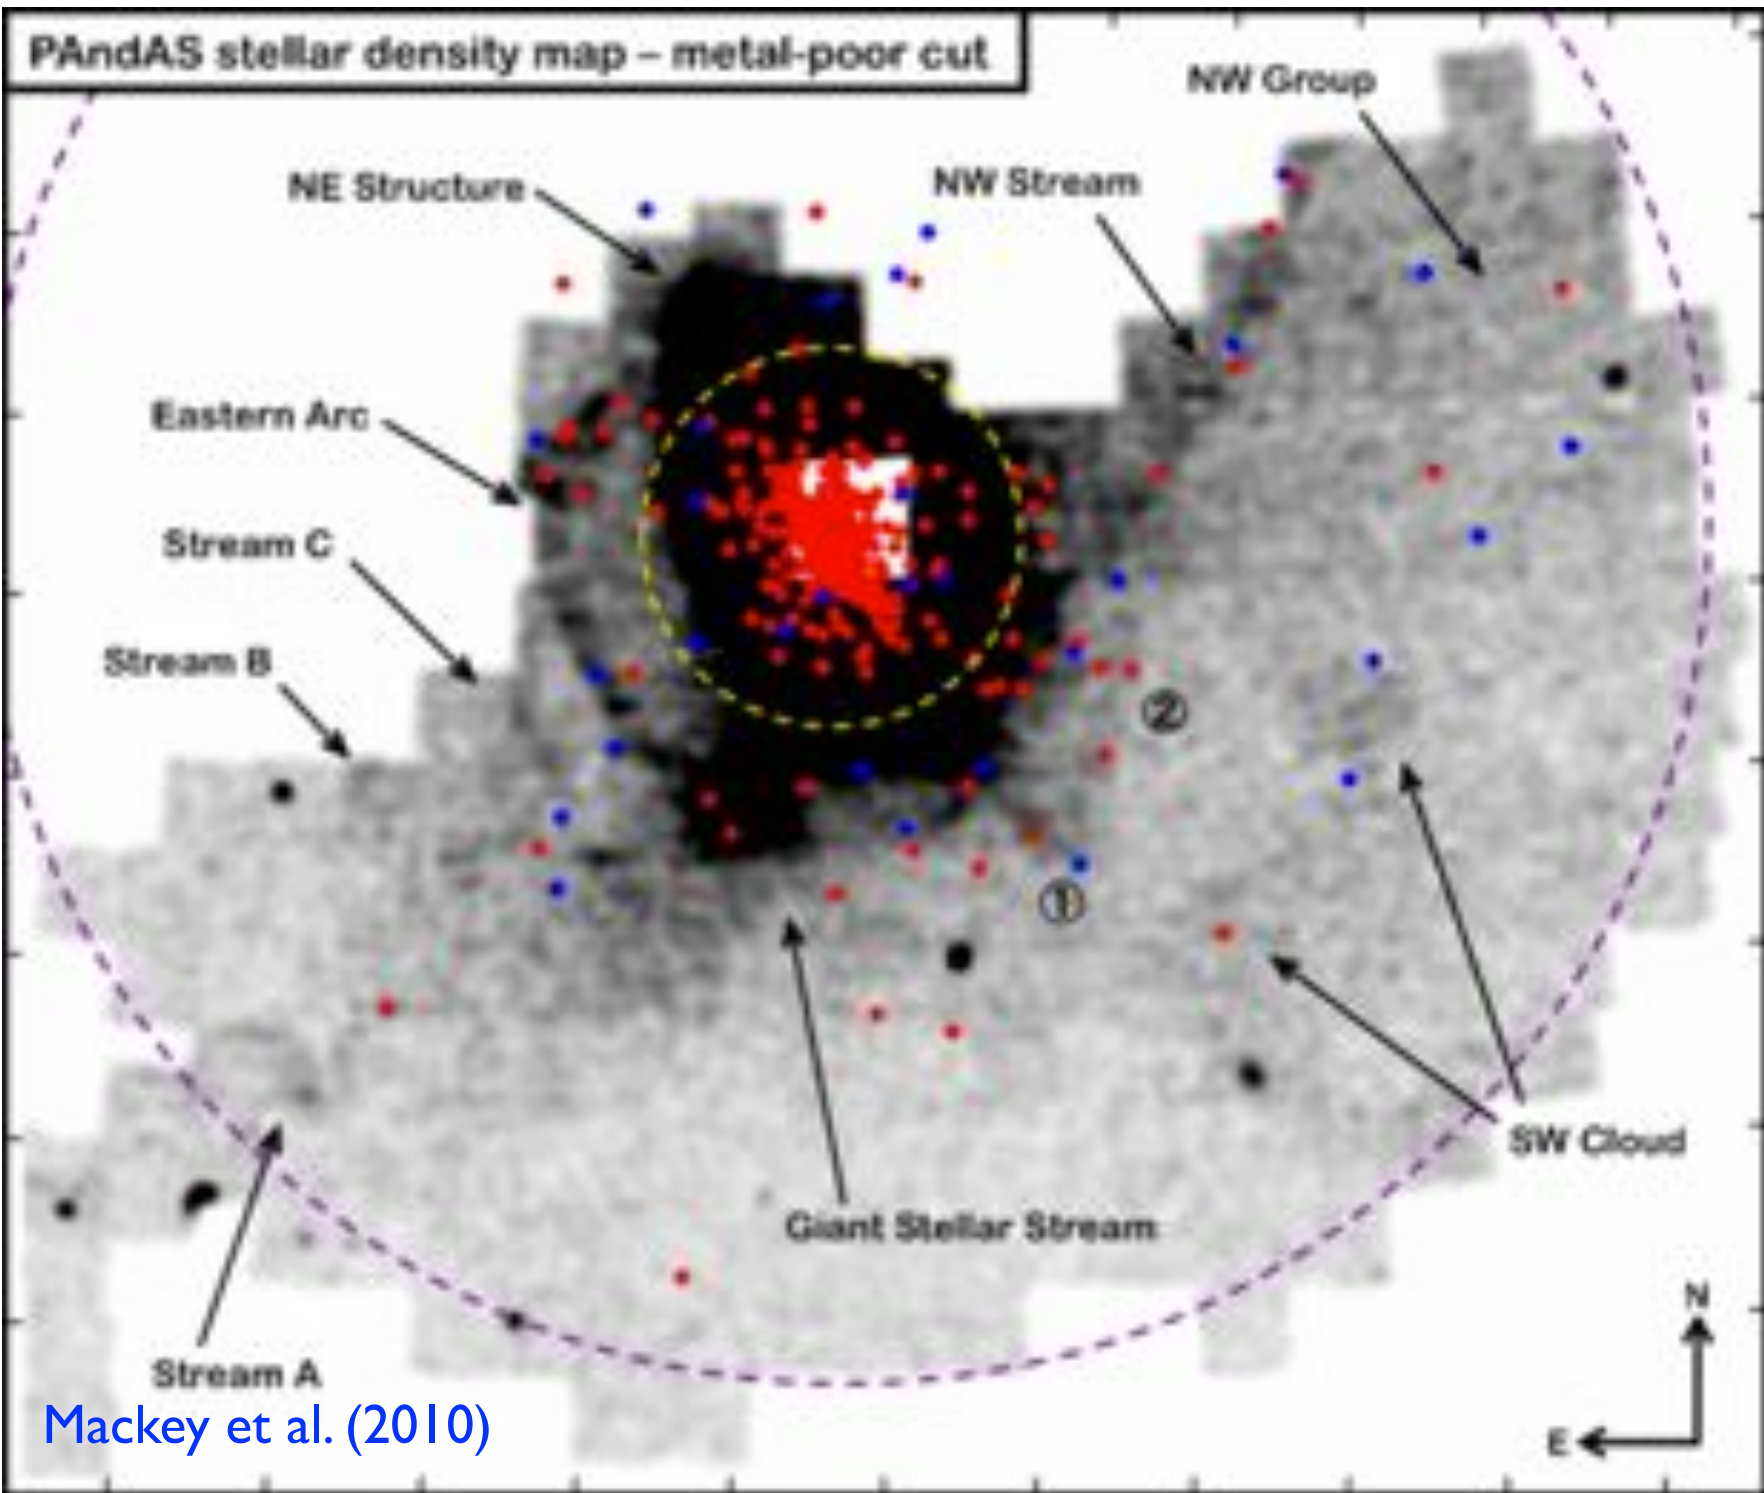

# “Extended” clusters in M31

large:  $r_{\text{eff}} \approx 20$  pc

faint:  $M_V \approx -7$

Huxor et al. (2005, 2011)

Mackey et al. (2010)

# GCI in Scl-dE1

large:  $r_{\text{eff}} \approx 20 \text{ pc}$

faint:  $M_V \approx -6.7$

Da Costa et al. (2009)

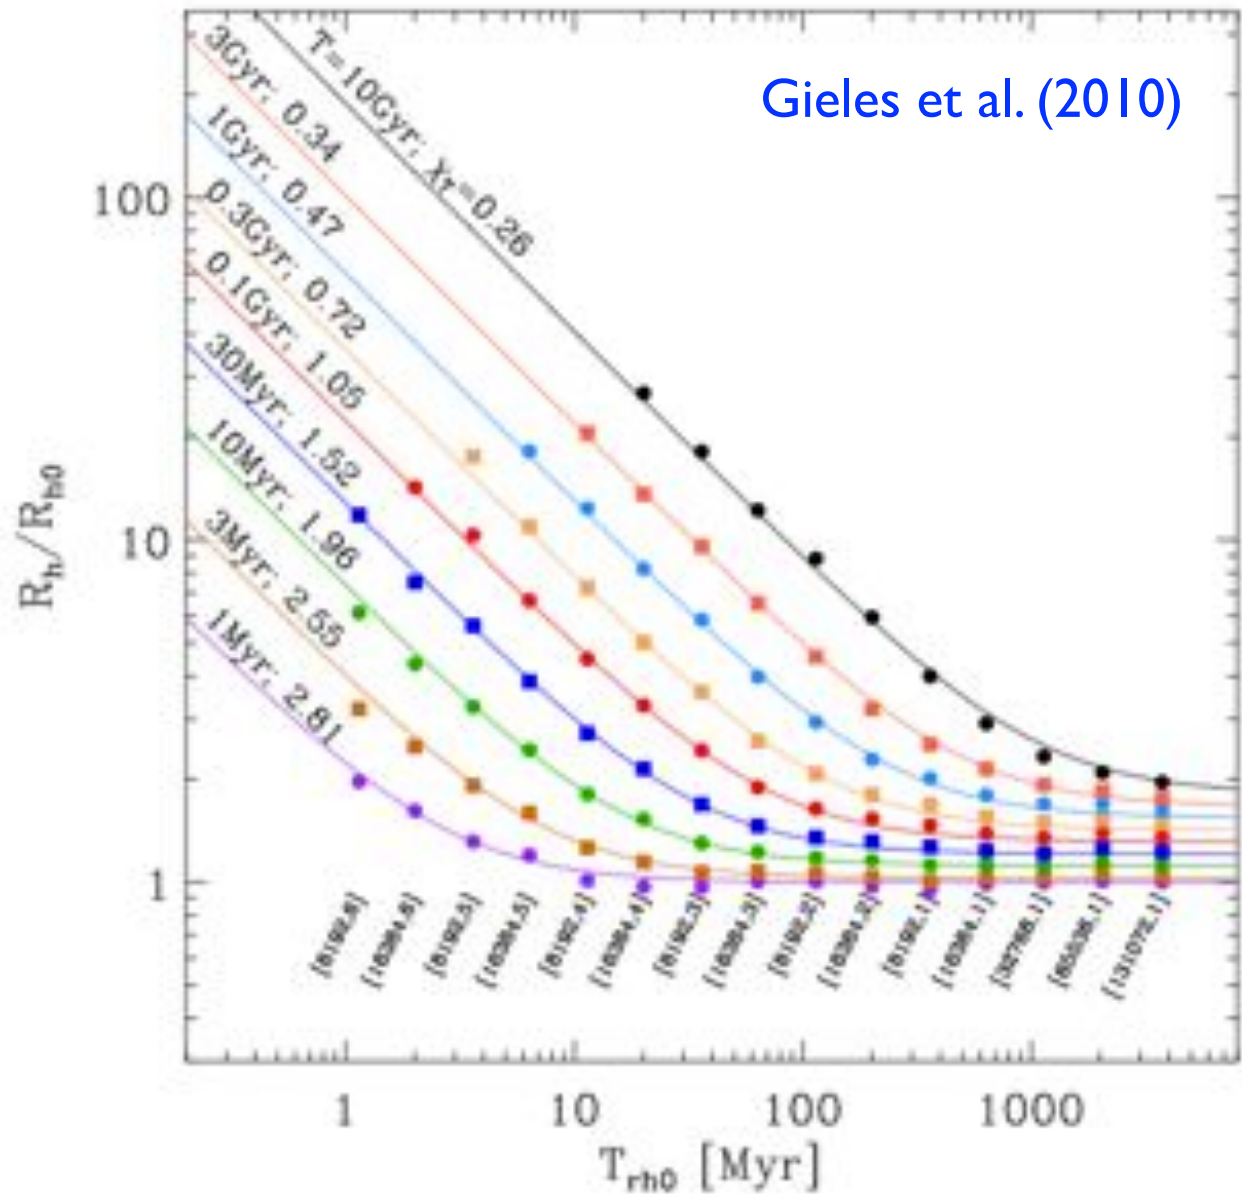

“Faint fuzzy” and “extended” clusters

**Fainter/fuzzier/more extended than ... ?**

Scenarios

Direct  $N$ -body  
simulations  
of expanding clusters  
(relaxation)

Gieles et al. (2010)

Direct  $N$ -body  
simulations  
of expanding clusters  
(relaxation)

Models with tides:  
Gieles, Heggie & Zhao (2011)  
Alexander & Gieles (2012)

“Faint fuzzy” and “extended” clusters

Fainter/fuzzier or more extended than ... ?

**Scenarios**

# Nature

Form in collisional ring galaxies  
(Cartwheel like interactions)  
(Burkert, Brodie & Larsen 2005)

Natural outcome of star formation  
at high pressure/Mach number  
(Elmegreen 2008)

# Nurture

Star cluster mergers  
(Fellhauer & Kroupa 2005; Assman  
et al. 2011)

# Nature

Form in collisional ring galaxies  
(Cartwheel like interactions)  
(Burkert, Brodie & Larsen 2005)

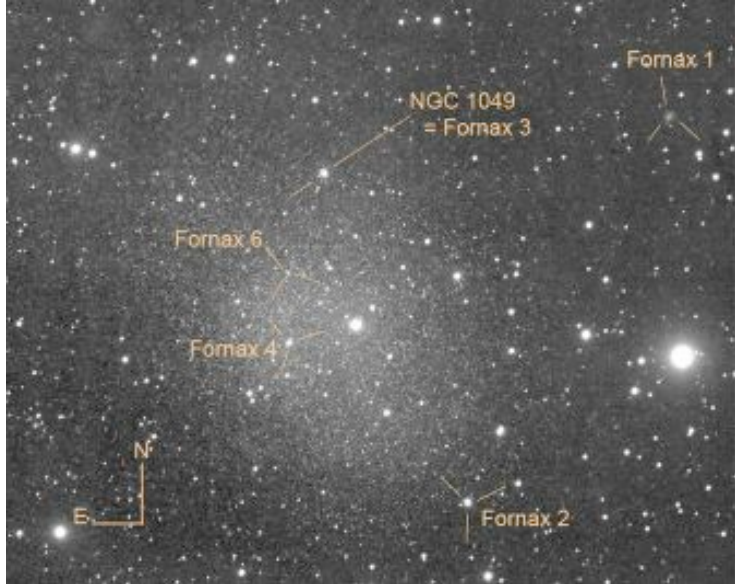

Natural outcome of star formation  
at high pressure/Mach number  
(Elmegreen 2008)

# Nurture

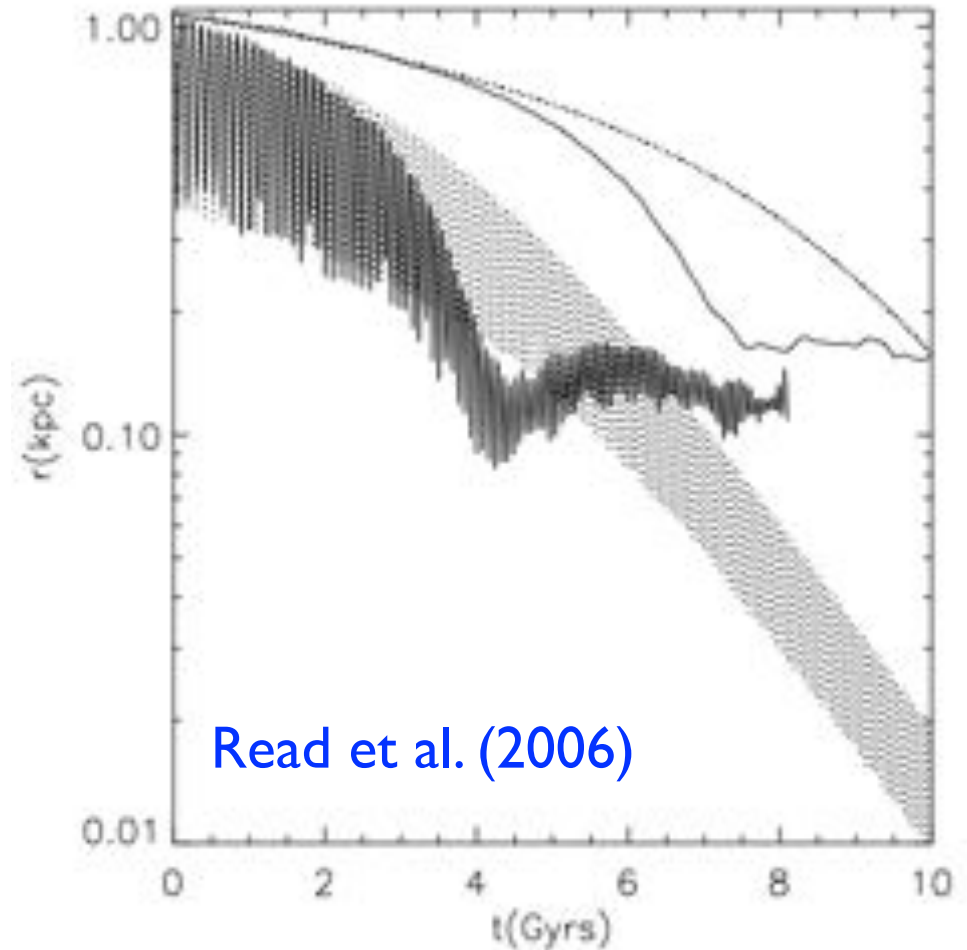

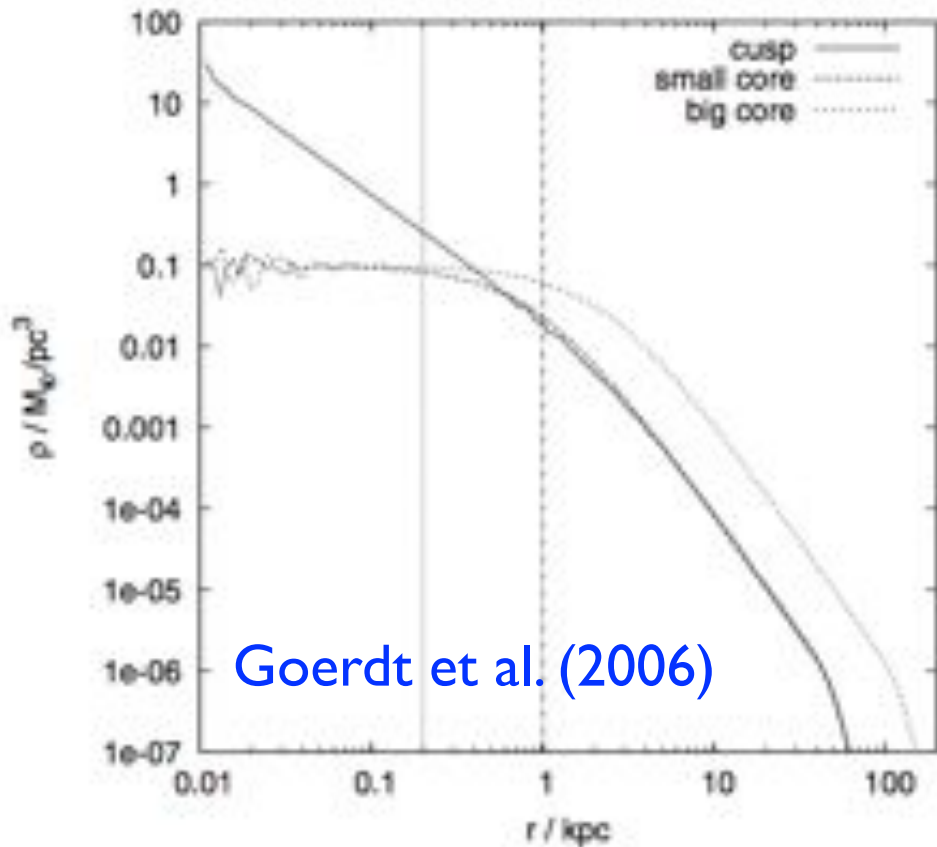

Star cluster mergers  
(Fellhauer & Kroupa 2005; Assman  
et al. 2011)

Are mergers between  
clusters expected?

How does the merger  
remnant evolve?

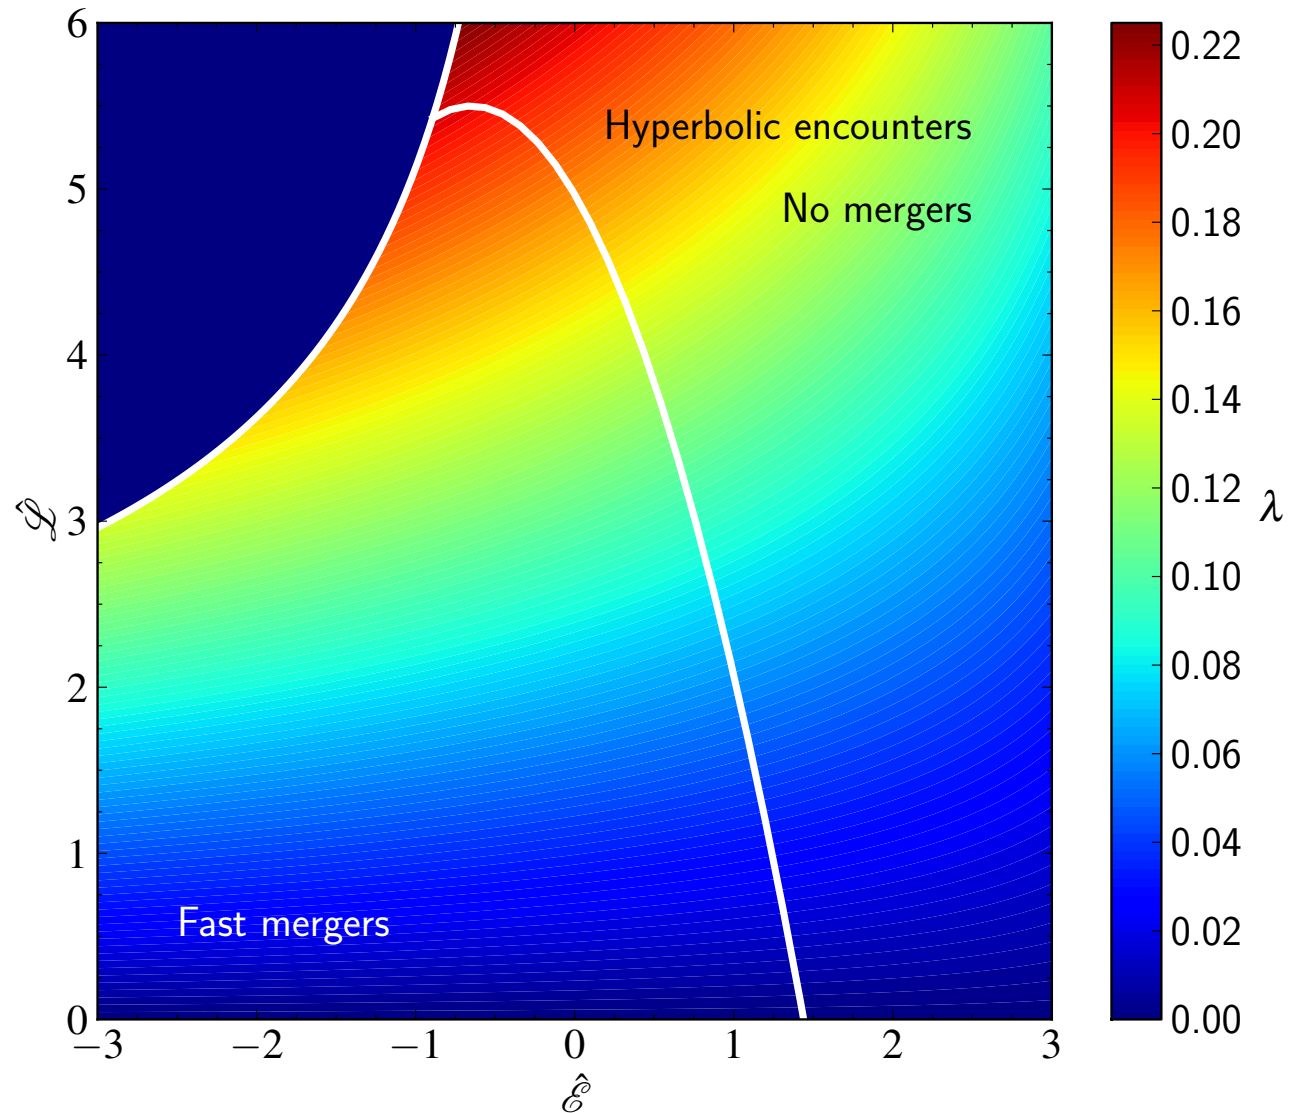

(No) dynamical friction in constant density cores of galaxies

(Detection of cored mass profiles by Walker & Peñarrubia 2011)

# Conditions for merging

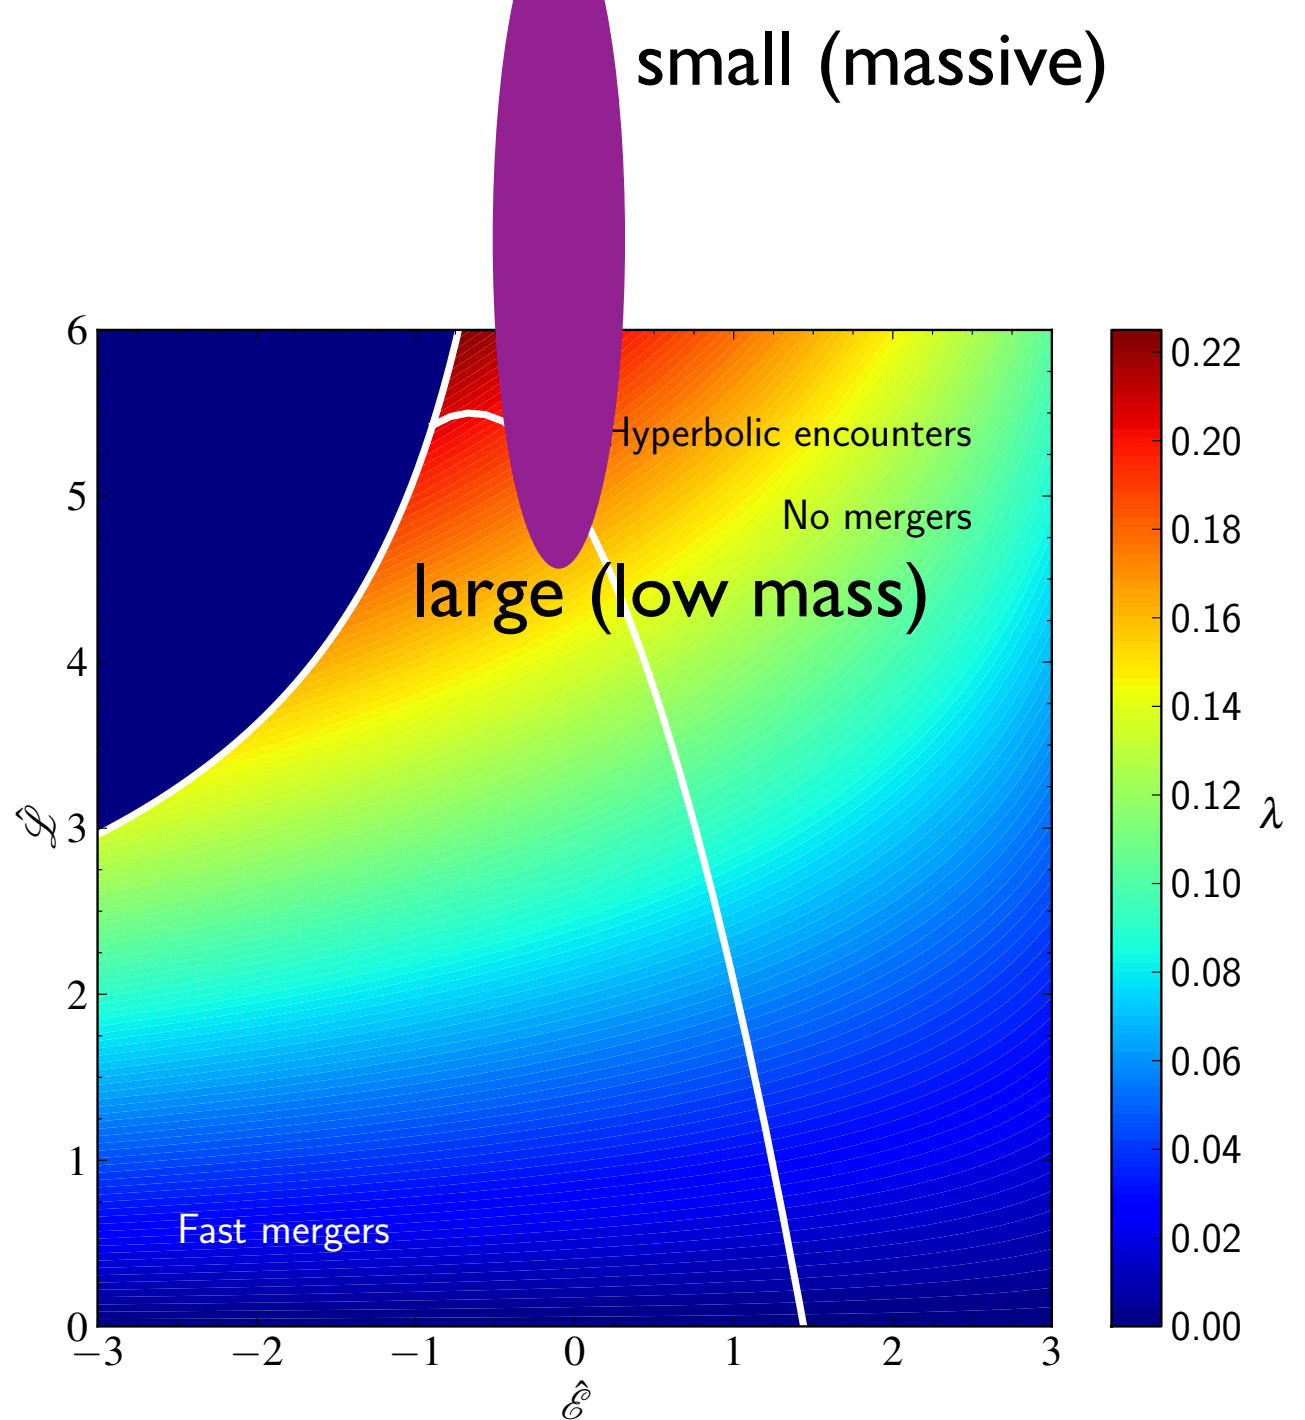

$$\hat{\mathcal{L}} \equiv \frac{L_{\text{orb}}}{r_h \sigma}$$
$$\hat{\mathcal{E}} \equiv \frac{E_{\text{orb}}}{0.5 \sigma^2}$$

# Conditions for merging

$$\hat{\mathcal{L}} \equiv \frac{L_{\text{orb}}}{r_h \sigma}$$
$$\hat{\mathcal{E}} \equiv \frac{E_{\text{orb}}}{0.5 \sigma^2}$$

# Palomar 14

## Condition:

2 clusters in cored dwarf  
massive enough to reach core by DF  
large enough to absorb AM

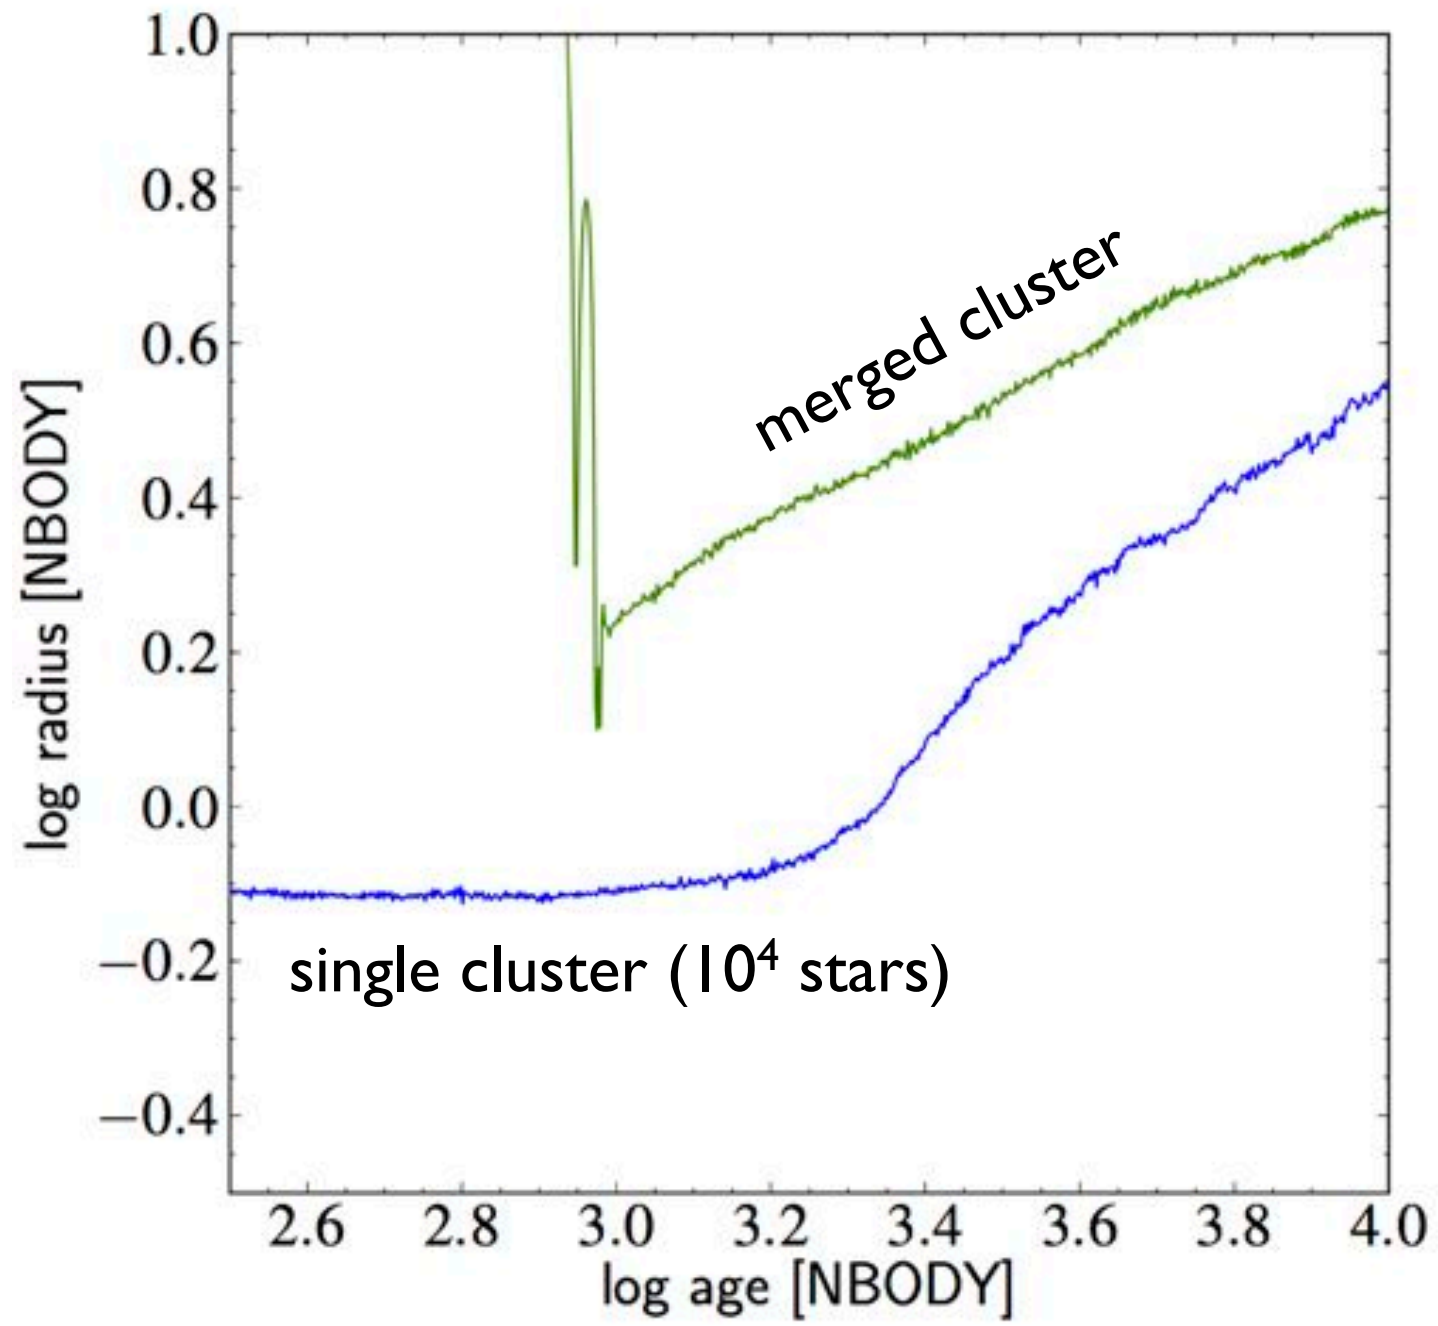

## Prediction:

Rotation and flattening

(Sollima et al. 2011)

“Faint fuzzy”/“extended” when fainter/fuzzier or more extended than:

$$\left( \frac{M}{10^5 M_{\odot}} \right) \left( \frac{r_{\text{eff}}}{7 \text{ pc}} \right)^3 \gtrsim 1$$

Mergers in (**cored**) dwarf galaxies can account for an additional factor of 2 in size

Look at structure: flattening (rotation=hard!)
