## Outline

- ❑ A brief review of wide-band aperture array antenna design
- ❑ AA-mid Antenna design for PrepSKA
- ❑ Conclusions and future work

## The SKA mid-frequency array

- The requirement is for approaching two octaves of bandwidth (400MHz to 1.4 GHz)
- A scan angle of at least +/-45degs
- Polarimetry is required on the radio astronomical sources so that two orthogonal polarisations are needed

# A brief review of wide-band aperture array antenna design

- Three structures have been compared in both theory and in hardware:
  - Vivaldi antenna
    - A structure developed by ASTRON using a thin metallised foil known as FLOTT
  - A modified Bunny Ear antenna incorporating comb line chokes[1]
    - All aluminium laser cut structure
  - A planar antenna using coupled ring radiators termed ORA (Octagonal Ring Antenna,[2])
    - Implemented using polystyrene dielectric and thin copper radiating rings

# Aperture Array Antennas

Operating frequency band:  
300MHz-1GHz,  $\pm 45^\circ$  scan angle

(a)

(b)

(c)

(d)

(e)

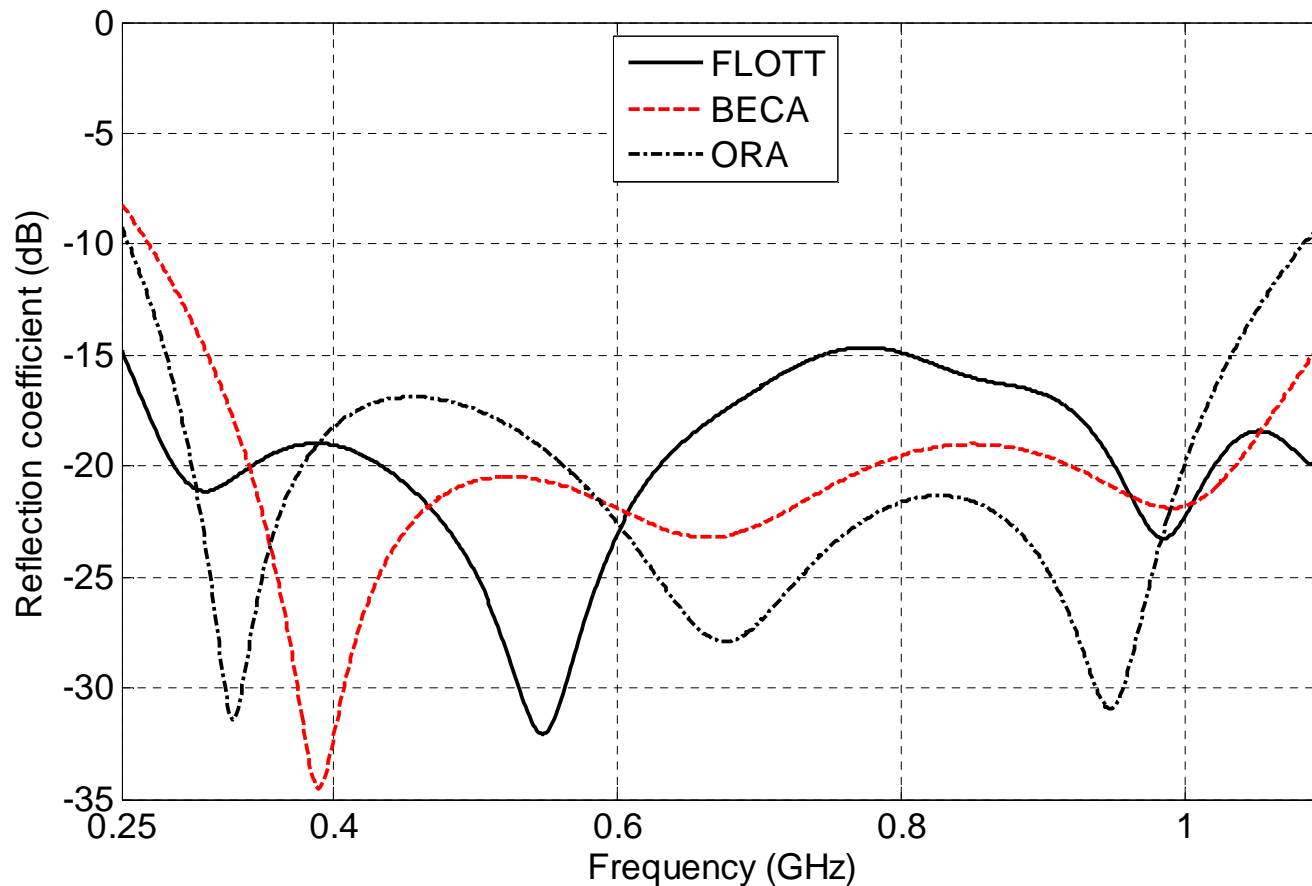

(f)

**FLOTT: (a)(d)**

**BECA: (b)(e)**

**ORA: (c)(f)**

# Active reflection coefficient

# Three candidate designs ( $16 \times 16$ finite arrays)

**FLOTT**

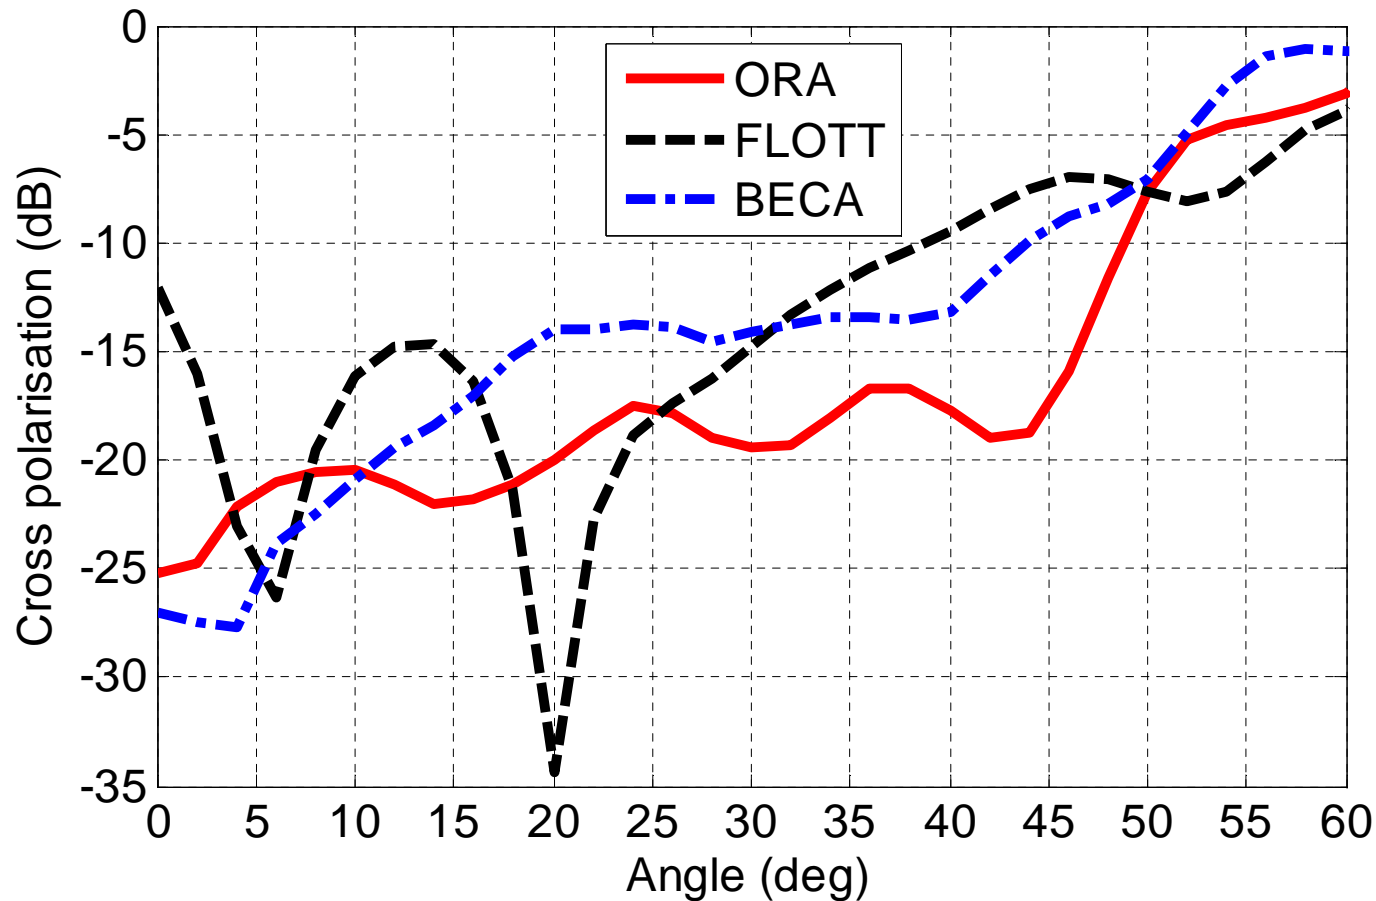

**BECA**

**ORA**

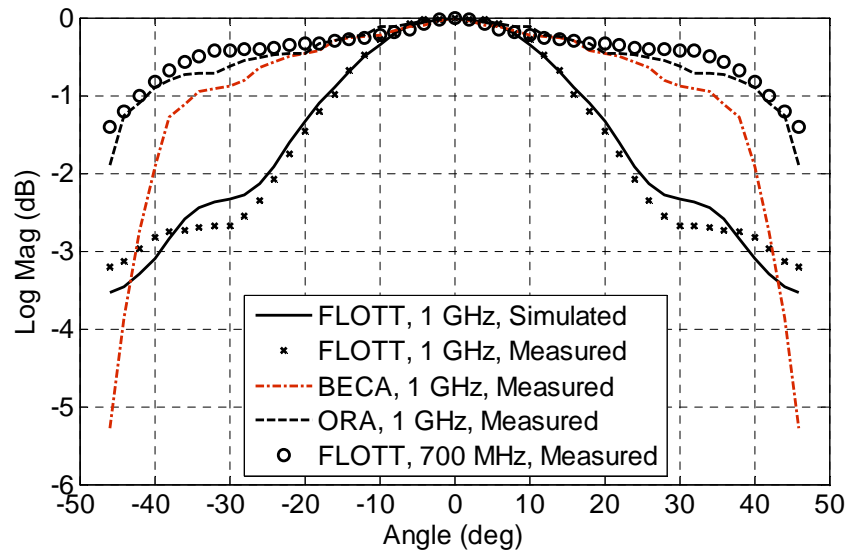

## Cross polarisation in the intercardinal plane at 1 GHz, based on the finite array measurement for the centre element

**D-plane  
45° Cut**

# Scanned element pattern for the centre element of the finite array

**E-plane (0° Cut)**

**H-plane (90° Cut)**

## Design Summary

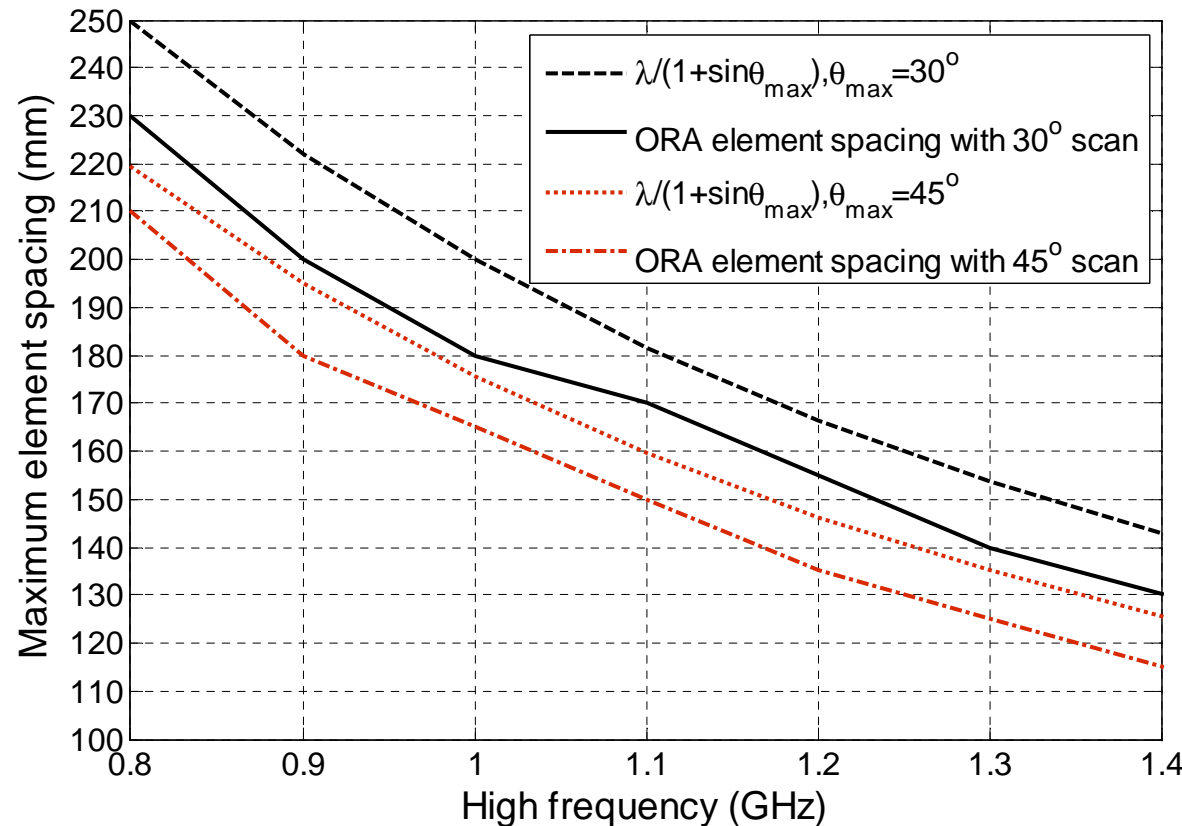

- ❑ Tapered slot antenna shows a higher cross polarization in the inter-cardinal plane (45°-plane)
- ❑ A long tapered slotline is needed to produce a broad frequency bandwidth, as a result, the radiation pattern can be narrow at the high end of frequency band
- ❑ ORA exhibits a broad radiation pattern and a smooth cross polarisation performance over the entire scan range

# AA-mid Antenna Design for PrepSKA

**The target Operating frequency band:  
400MHz-1.4GHz,  $\pm 45^\circ$  scan angle**

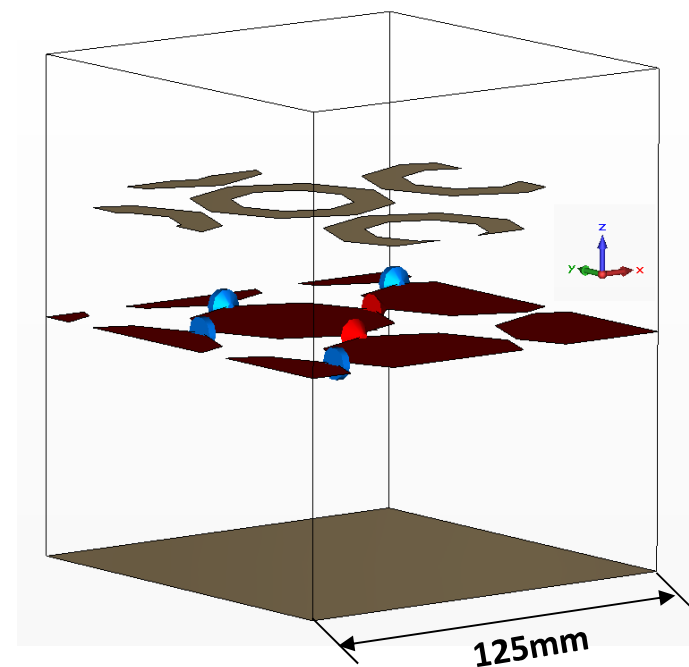

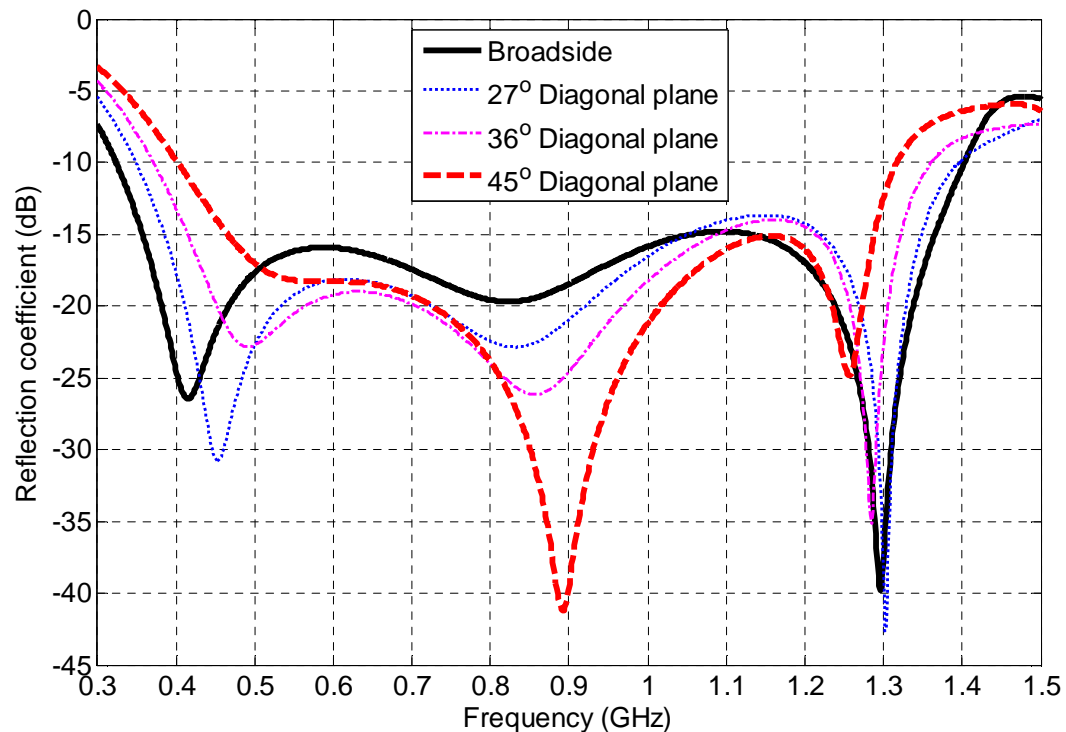

- The element separation for the AA-mid aperture array
- The feeding methods of ORA
- The ORA finite array analysis

# Element separation for AA-Mid

The maximum element spacing in the array is limited by the appearance of grating lobes, and the electromagnetic interactions between the elements with scan, the resulting numbers are not normally the same

# The infinite ORA array with 125 mm element separation

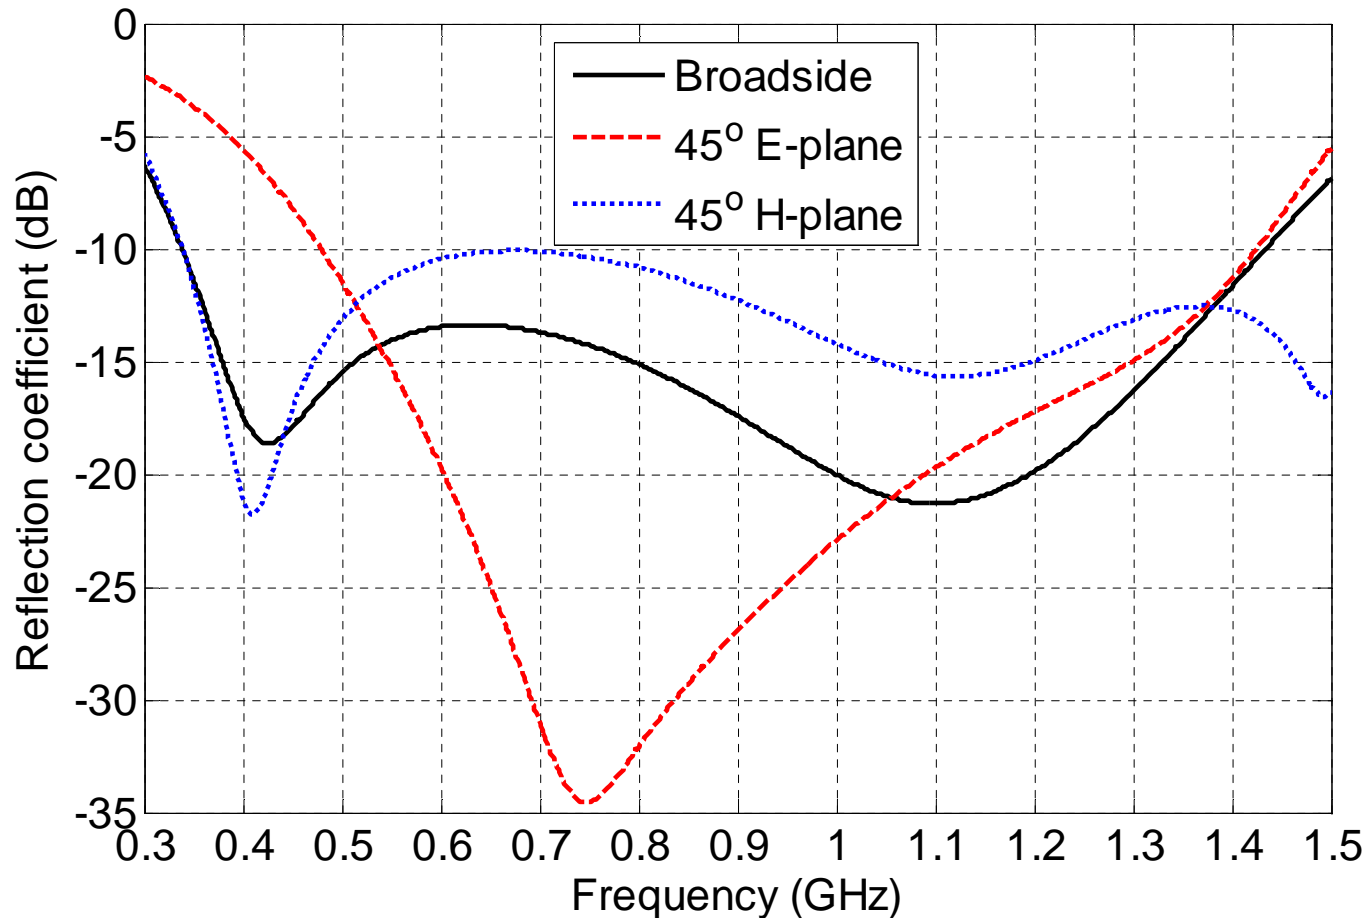

# The infinite ORA array with 125mm element separation

**400MHz-1350MHz, maximum 45° scan angle**

# The infinite ORA array with 112 mm element separation

**450MHz-1400MHz, maximum 45° scan angle**

# Feeding methods for ORA

# Coplanar waveguide feed for EM measurements, SKADS

**50 ohms single-ended output, feasible for radiation pattern measurement, but this balun can be lossy!**

# Single-ended and differential feeding methods

The single-ended stripline

Differential coaxial cable feeding

# ORA performance with 50ohms stripline feed, 112mm

# ORA performance with differential coaxial cable feeds, 112mm element spacing

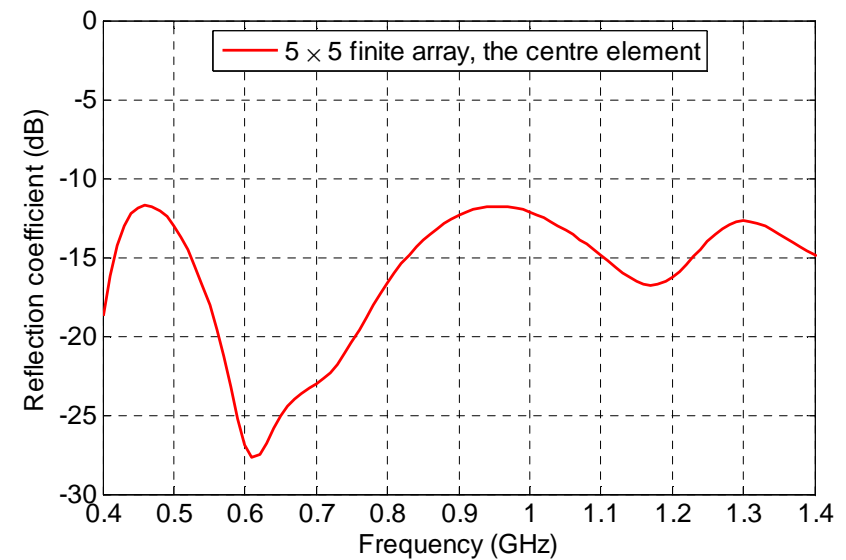

# The ORA Finite Array Analysis

## The passive reflection coefficient for ORA with the stripline feed

The centre element in a 5×5 array with all the rest elements are loaded

# Surface current on the conducting sheets for a single element excitation

**400MHz**

**900MHz**

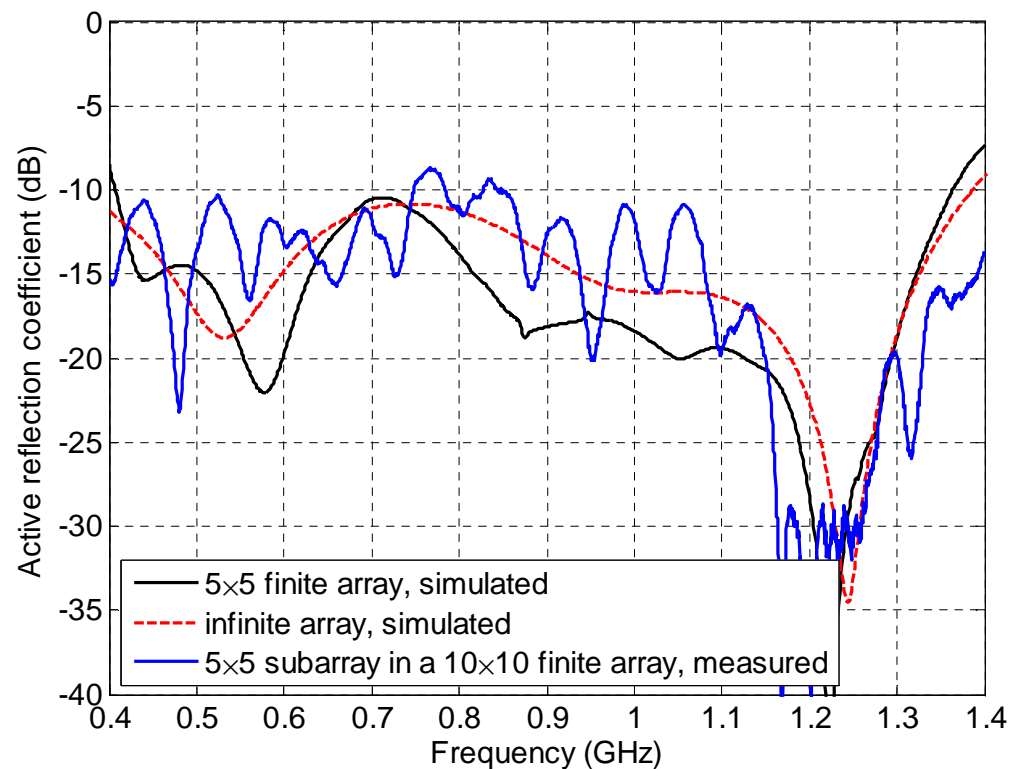

**1400MHz**

## Single-ended Stripline feed for the 5x5 subarray of the 10x10 finite array tile

### The active reflection coefficient

# Differential feeding method, passive reflection coefficient measured

Element 13

Element 1

## Conclusions

- Three different structures have been designed and performance compared
  - The Vivaldi is well known and provides broadband performance
    - It suffers from potentially high cross-polarisation in the inter-cardinal planes
    - Care must be taken to avoid narrow frequency resonances in the input impedance
  - BECA offers slightly improved cross polarisation and less susceptibility to input resonances but is potentially more complex
  - ORA provides a planar array alternative which is promising, has low scan loss and lower cross-polarisation with potentially simpler construction but requires further investigation for large scale manufacture

Thank you very much!
