

Notes on Willice's essay:

- **Appearance, layout, figures; references**
 - Very good; sections and figures and references look professional – not much to advise for future essays/reports etc.
- **Content/clarity**
 - Some good material has been gathered together but the overall structure of the argument could flow better – the theory discussion rather jumps about as opposed to moving on from one point to another in a logical series of steps - as noted in the final “bubble” comment in the text . You should also have reminded the reader more about the need to get rid of $1/2$ of the gravitational energy (link to virial theorem) and how the rotating collapsing cloud gets rid of angular momentum - you never mentioned angular momentum in the essay.
- **Standard of English**
 - Variable and needs care to be your own sub-editor – see the many places with comments in the text. In future it will be useful to get another person to read what you have written and look for errors. By the way... we all get others to read our own text - so this is just a professional comment.
