

UK-Germany National Astronomy Meeting NAM2012
Manchester, UK, 26 – 30 March 2012

The electronic absorption properties of PAHs in view of the observed interstellar UV-vis extinction

Mathias Steglich
Laboratory Astrophysics and Cluster Physics Group
of the Max Planck Institute for Astronomy
at the Institute of Solid State Physics,
Friedrich Schiller University Jena

Outline

- 1 **Introduction: Astrophysical background**
- 2 **UV-vis absorption spectra of individual PAHs**
- 3 **UV-vis absorption spectra of PAH mixtures**

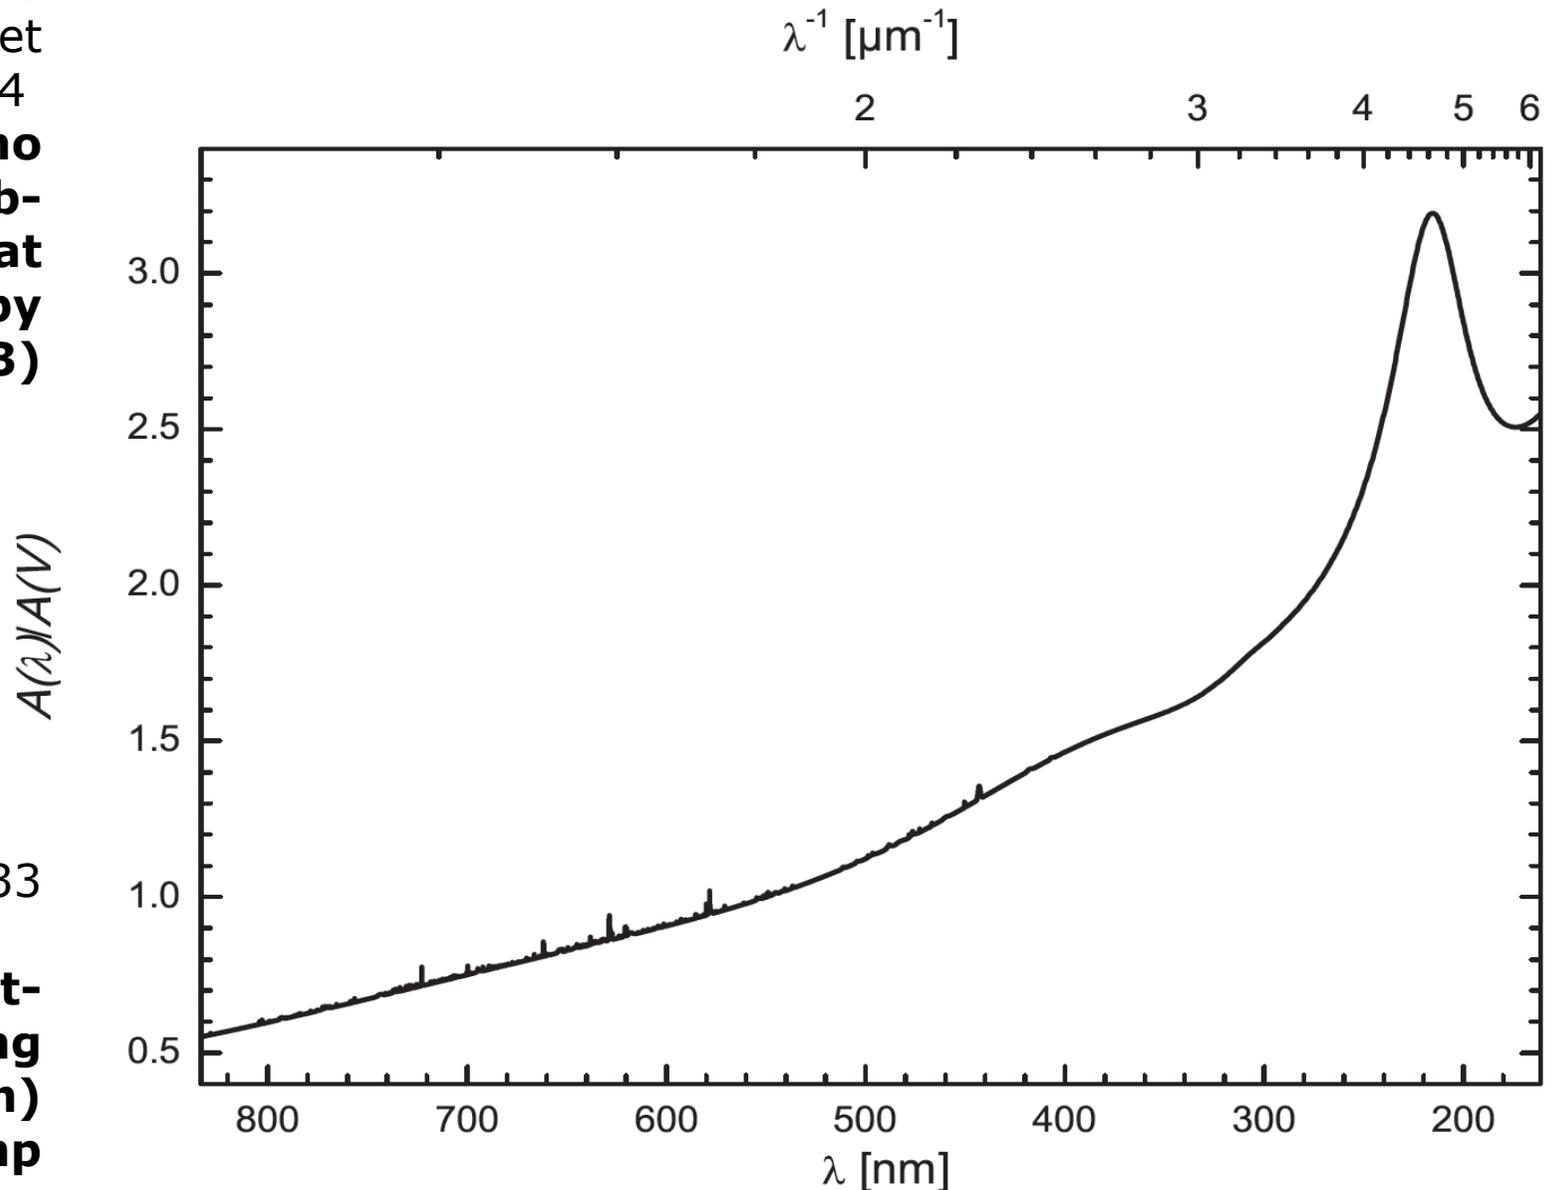

Outline

- 1 **Introduction: Astrophysical background**
- 2 UV-vis absorption spectra of individual PAHs
- 3 UV-vis absorption spectra of PAH mixtures

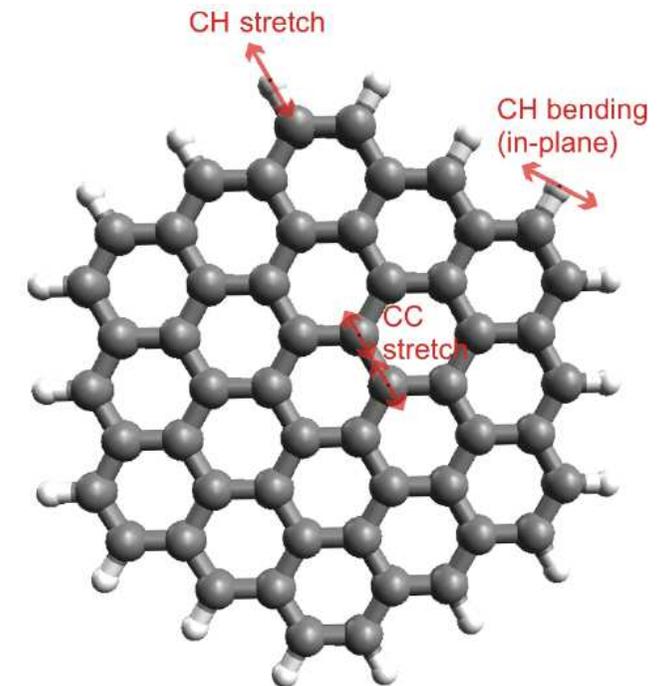

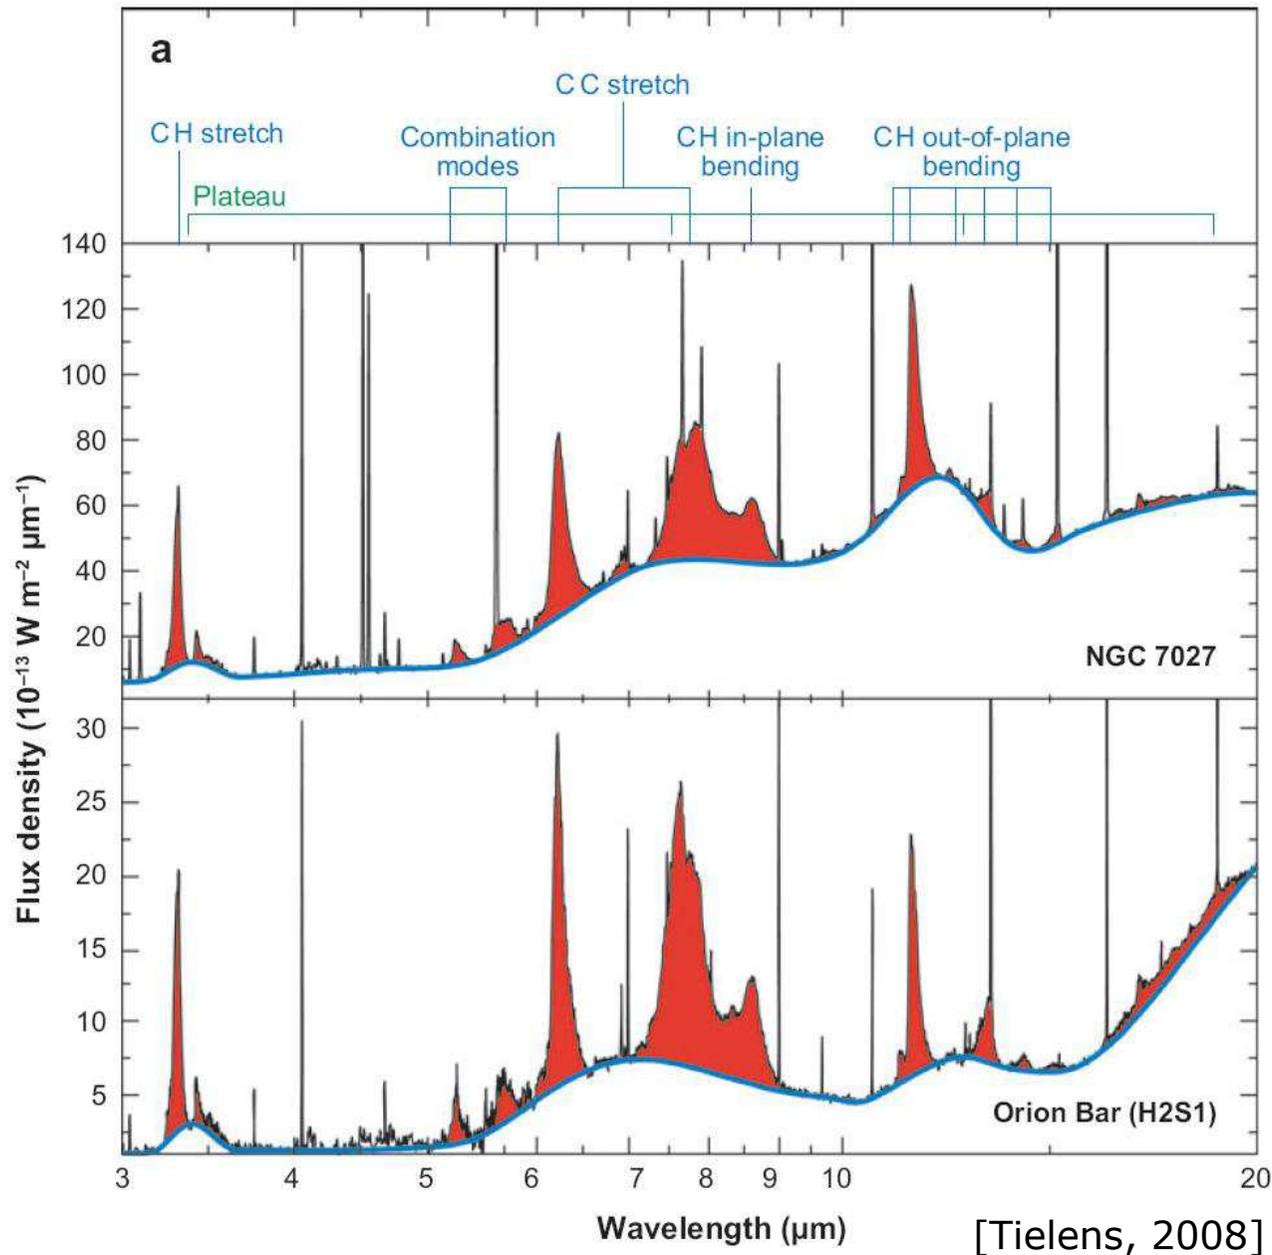

Interstellar extinction curve: DIBs & UV bump

- Gredel et al., A&A 530 (2011) A26; Salama et al., ApJ 728 (2011) 154
 → **for $\lambda < 400$ nm, no narrow DIB-like absorption bands that could be caused by polyatomic ($N > 3$) molecules**

- Xiang et al., ApJ 733 (2011) 91
 → **no correlation between nine strong DIBs (570 - 638 nm) and the UV bump (217.5 nm)**

Aromatic IR emission bands

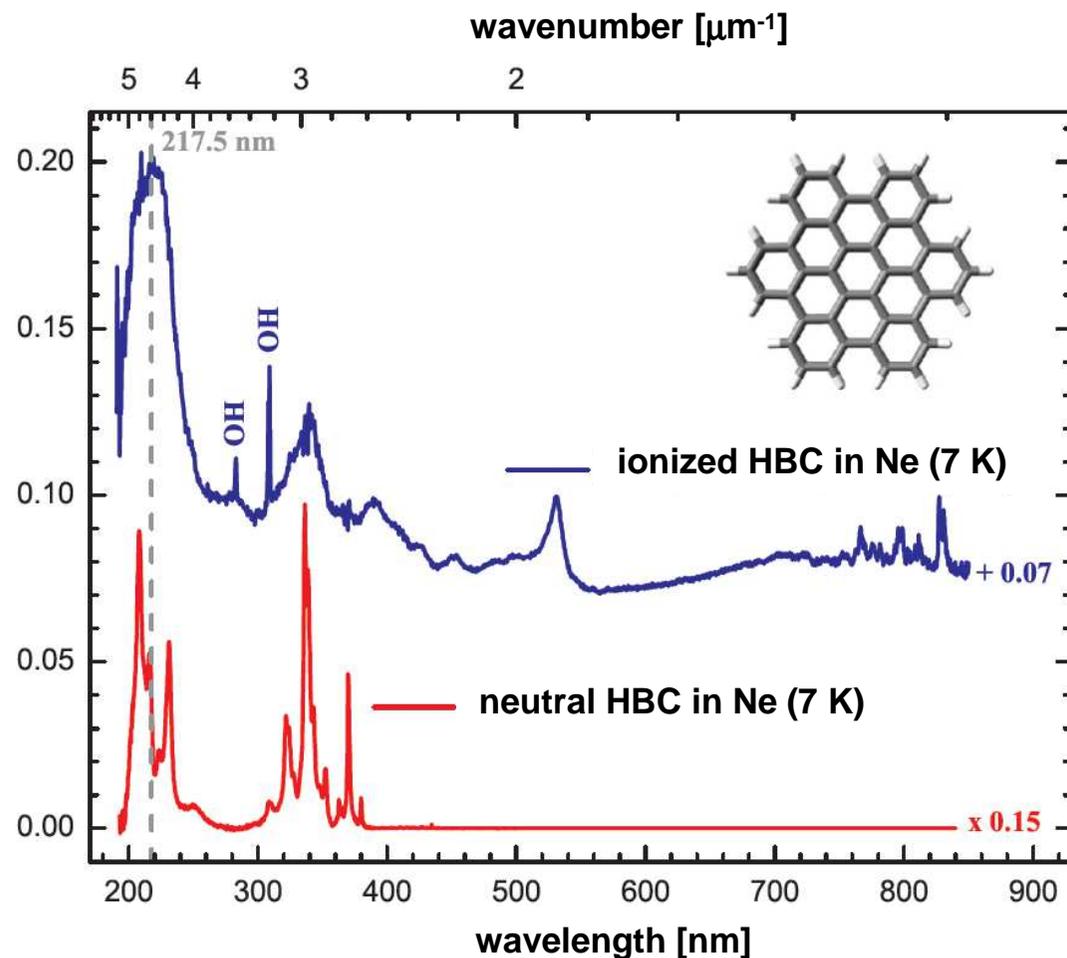

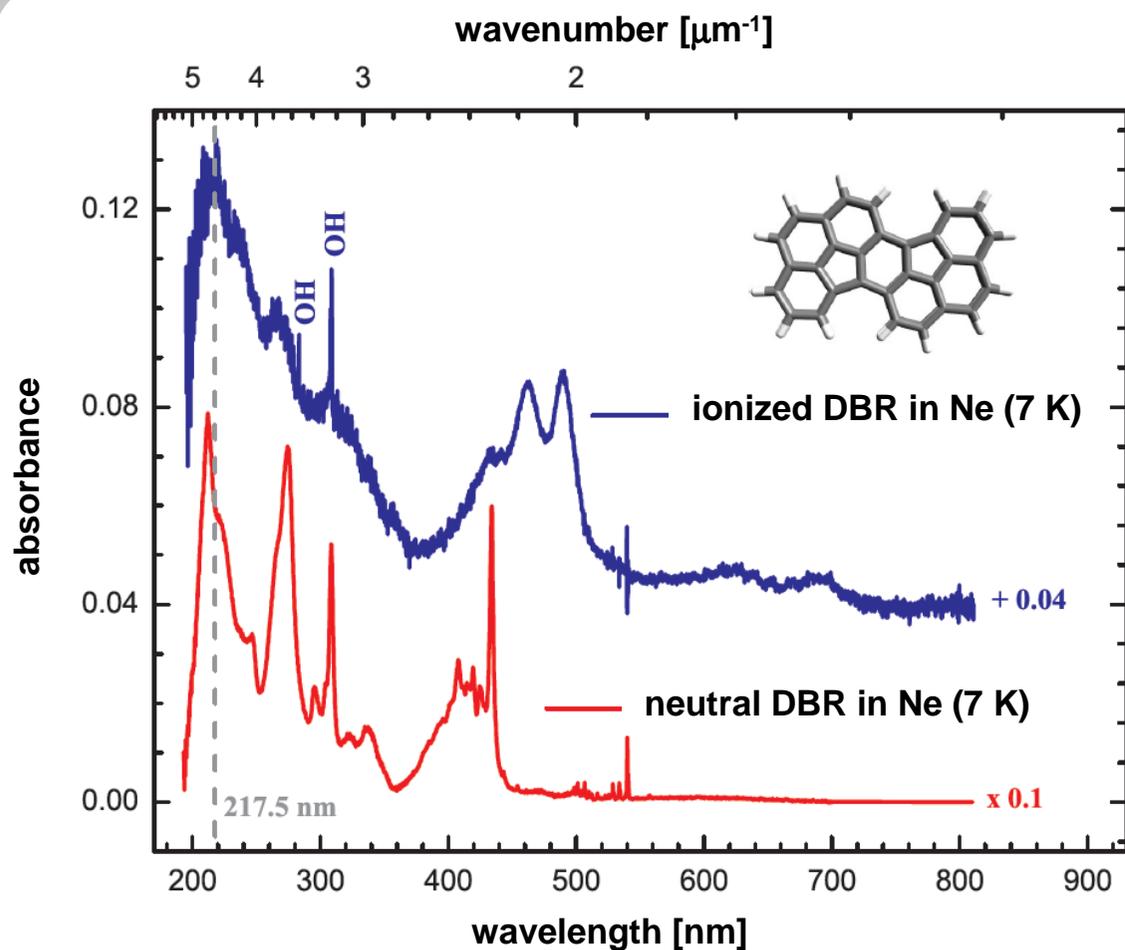

← →
 ~ 1 nm; ca. 20 hexagons;
 ca. 50 C and 20 H atoms

Outline

- ① Introduction: Astrophysical background
- ② **UV-vis absorption spectra of individual PAHs**
- ③ UV-vis absorption spectra of PAH mixtures

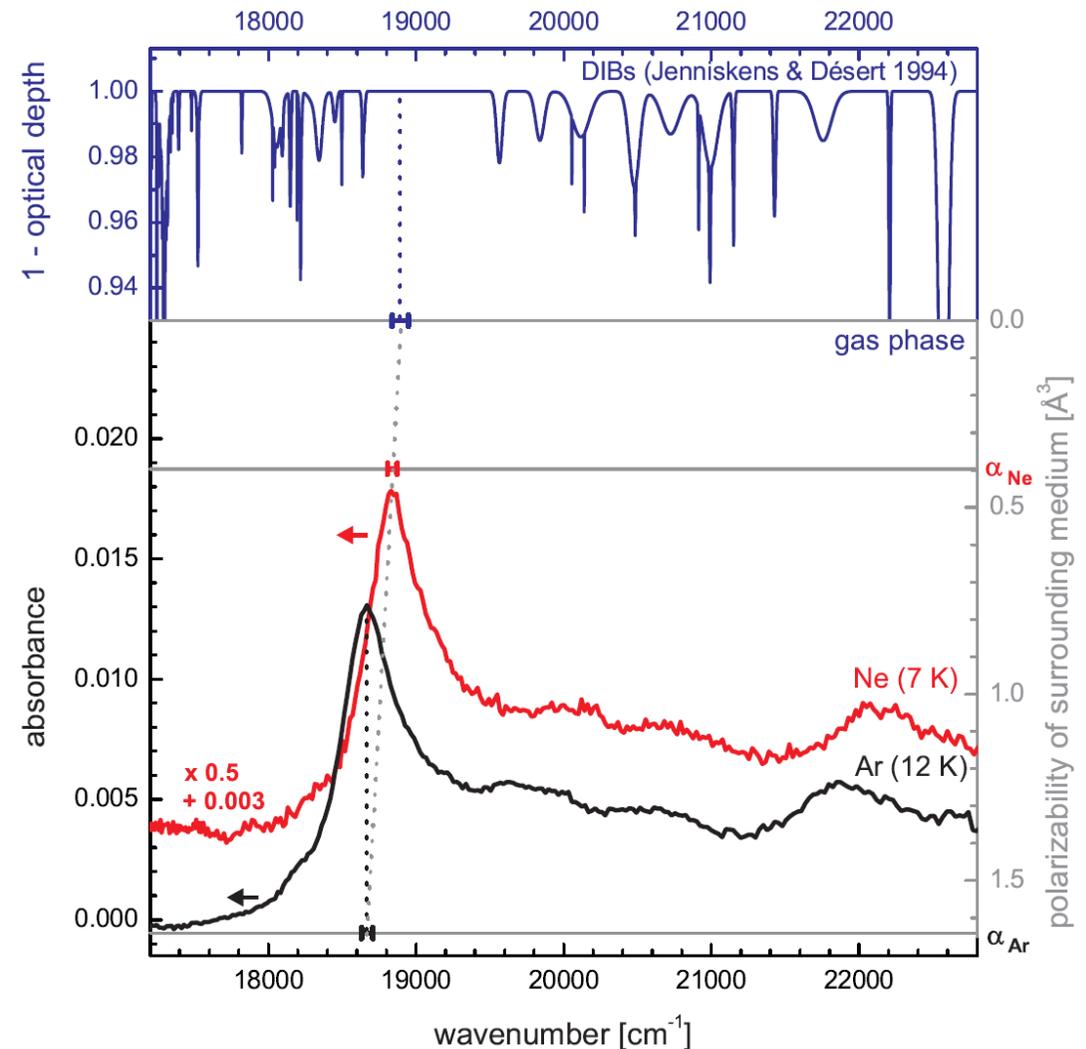

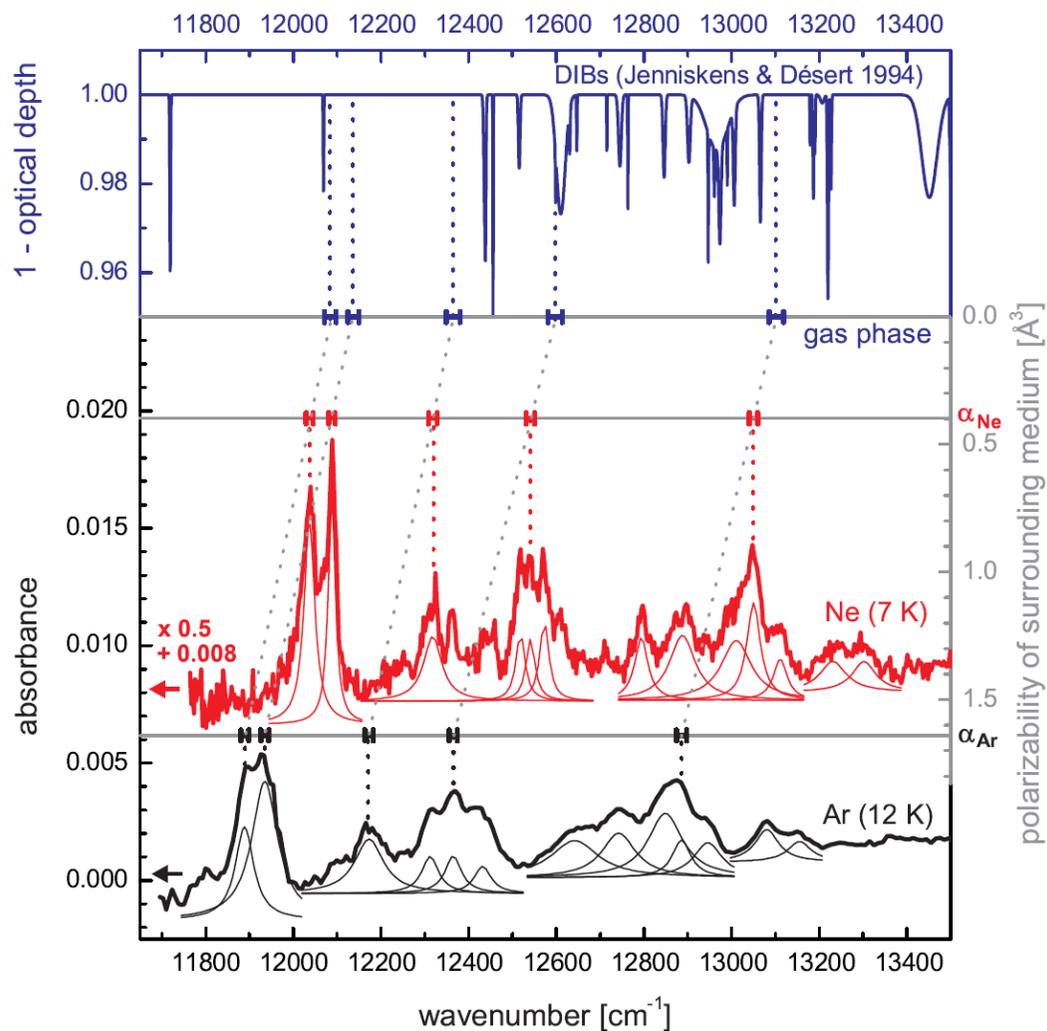

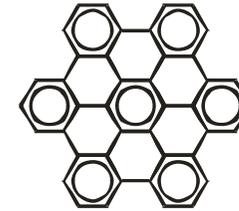

Comparison of specific PAHs in neutral and ionized form

Ionized HBC ($C_{42}H_{18}$) and the DIBs

- **"all-benzenoid" PAH HBC** → **high stability (higher abundance than other similarly-sized PAHs?)**

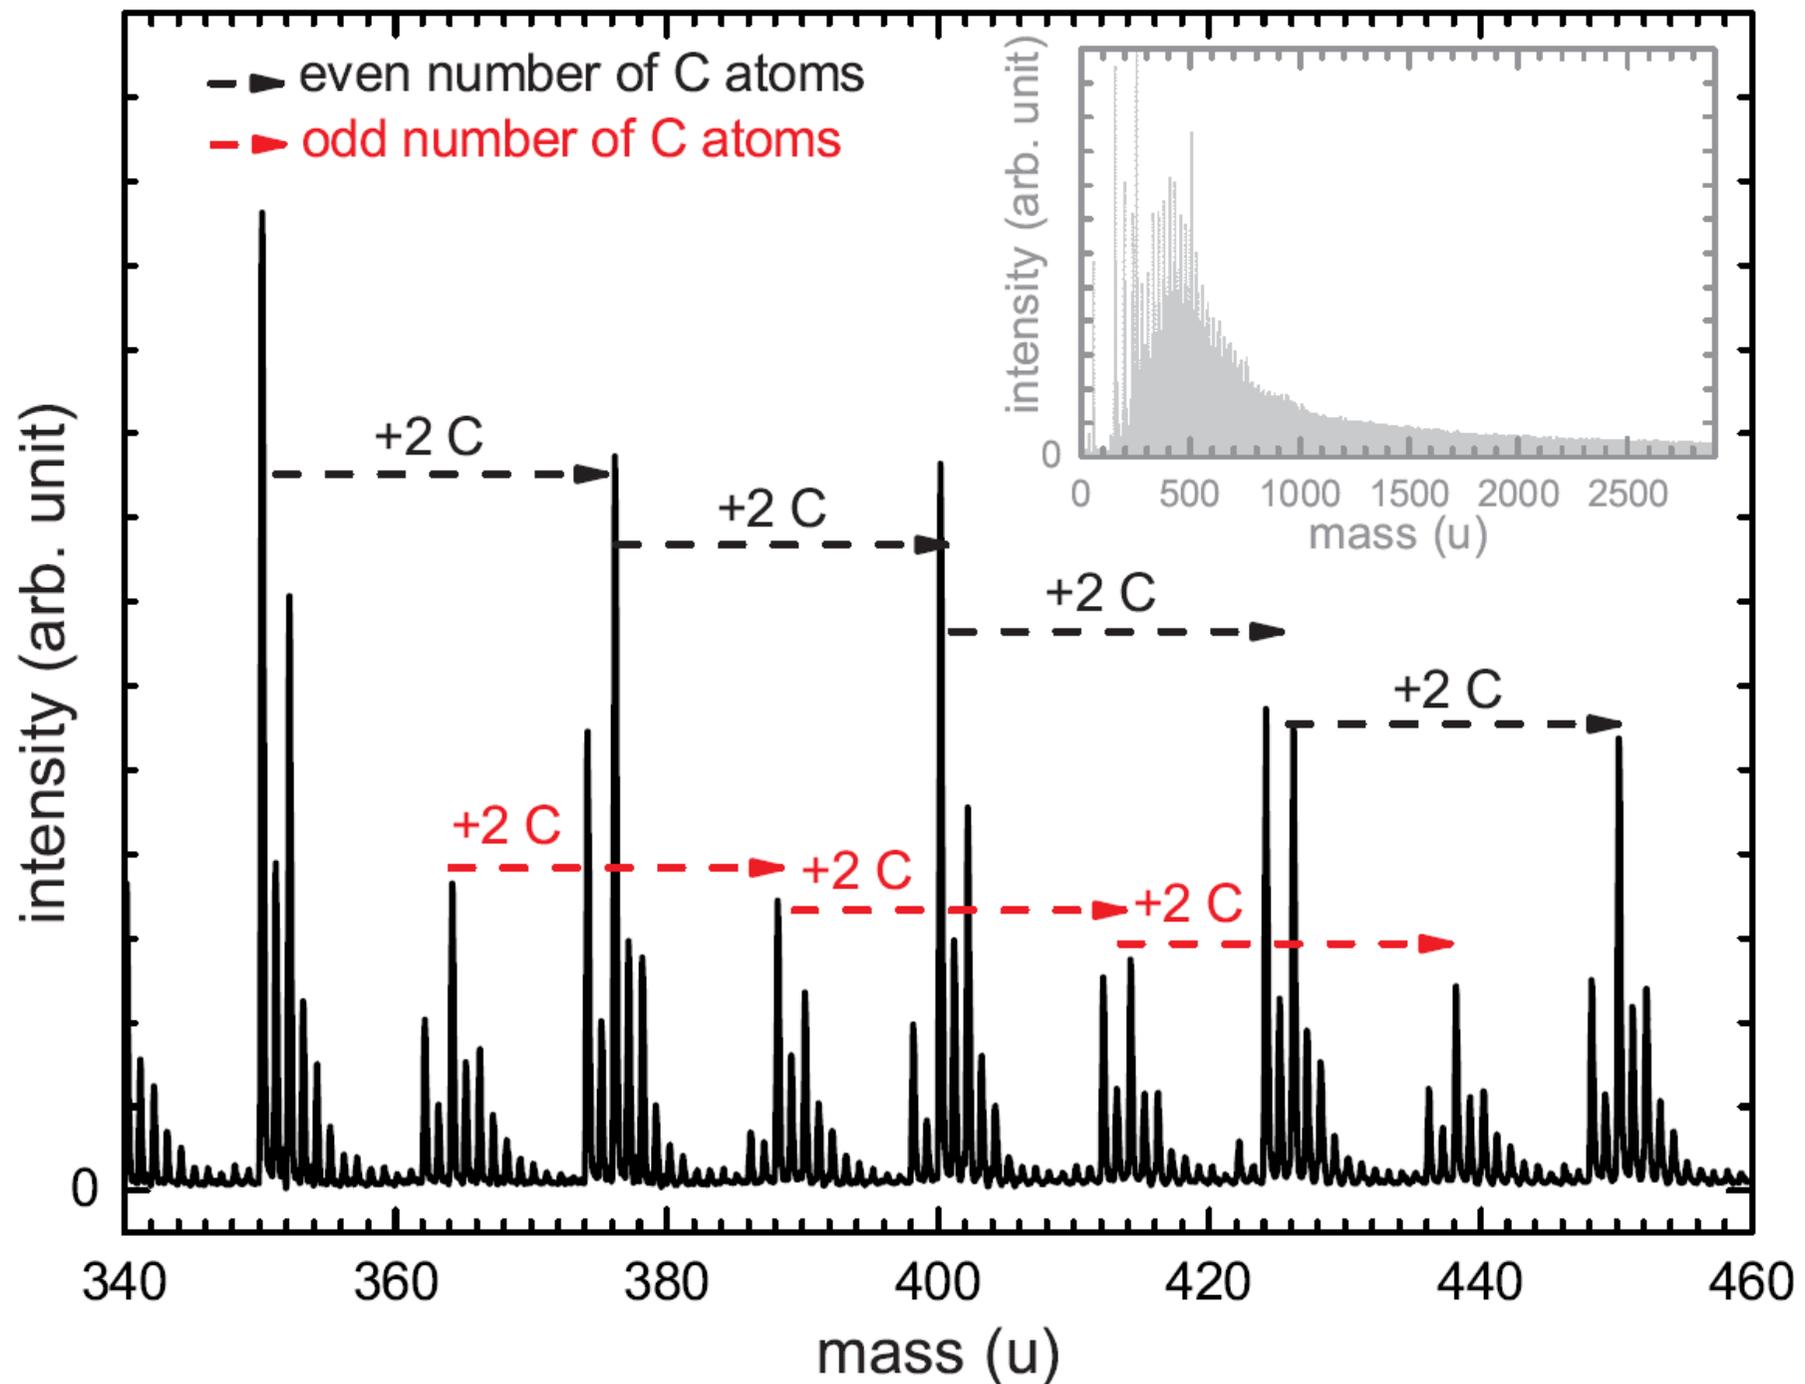

[T. P. Troy & T. W. Schmidt, MNRAS 371 (2006) L41]

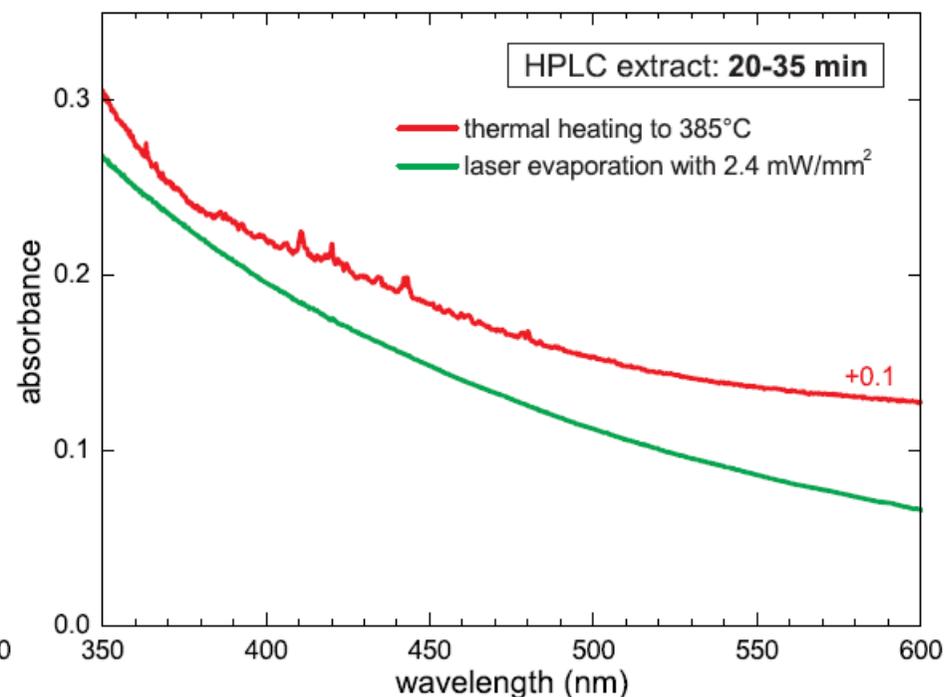

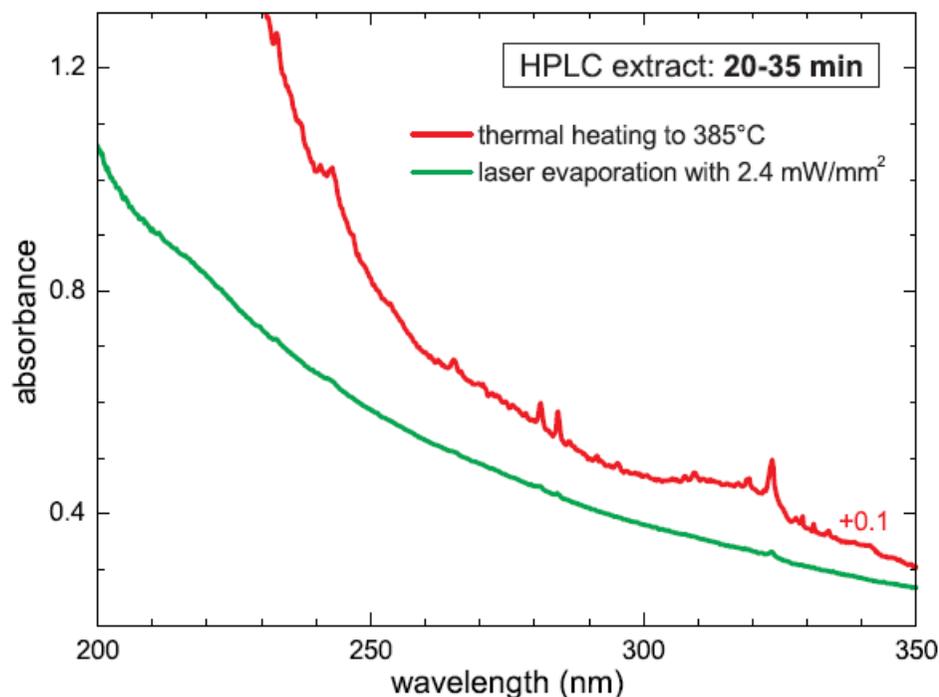

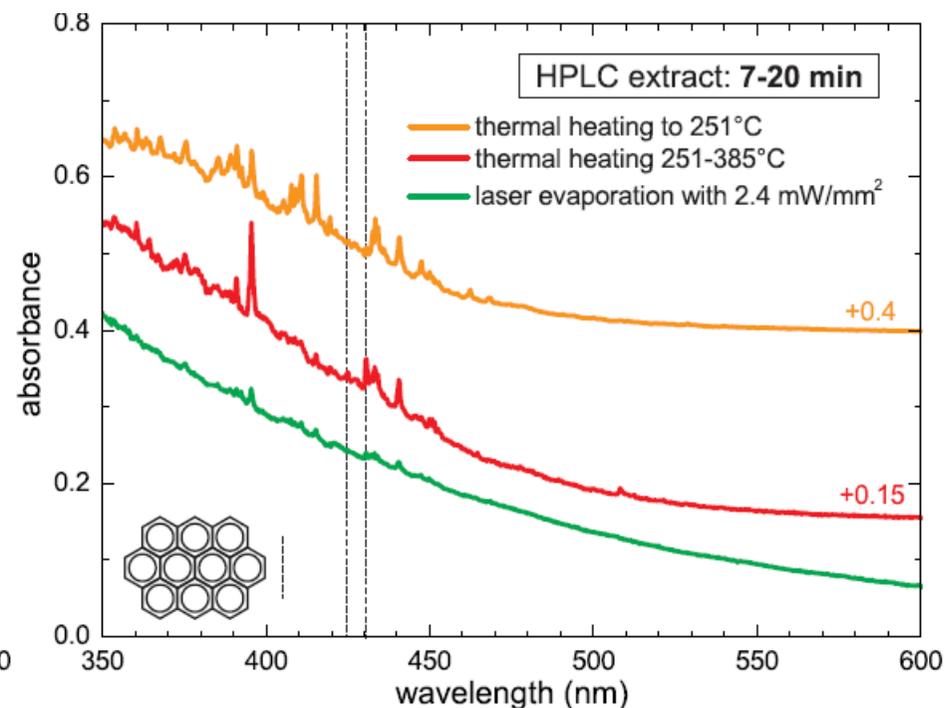

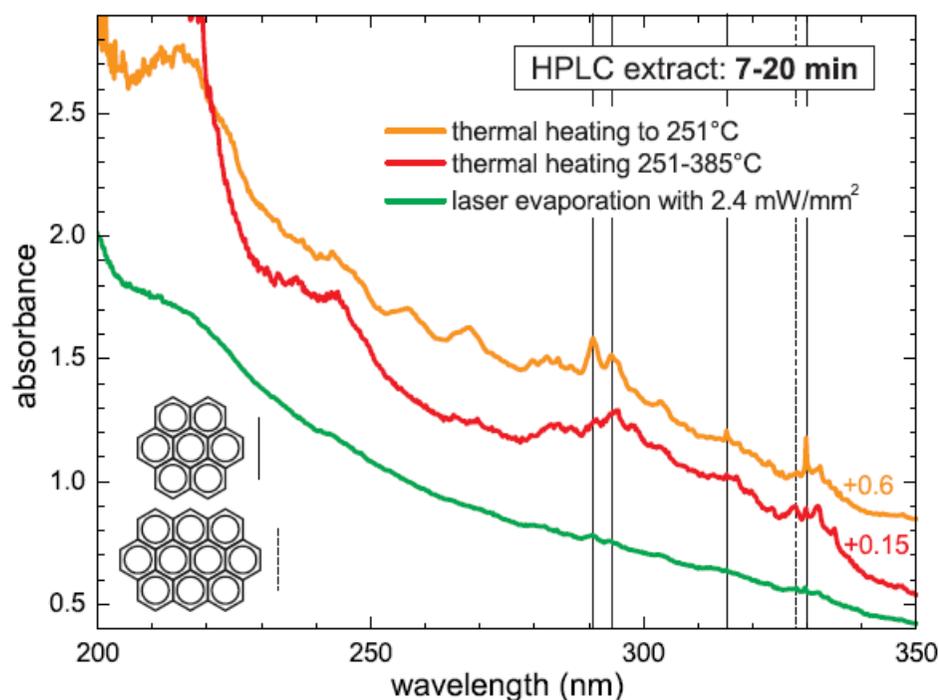

Outline

- ① Introduction: Astrophysical background
- ② UV-vis absorption spectra of individual PAHs
- ③ **UV-vis absorption spectra of PAH mixtures**

MALDI-TOF measurements of laser pyrolysis condensate

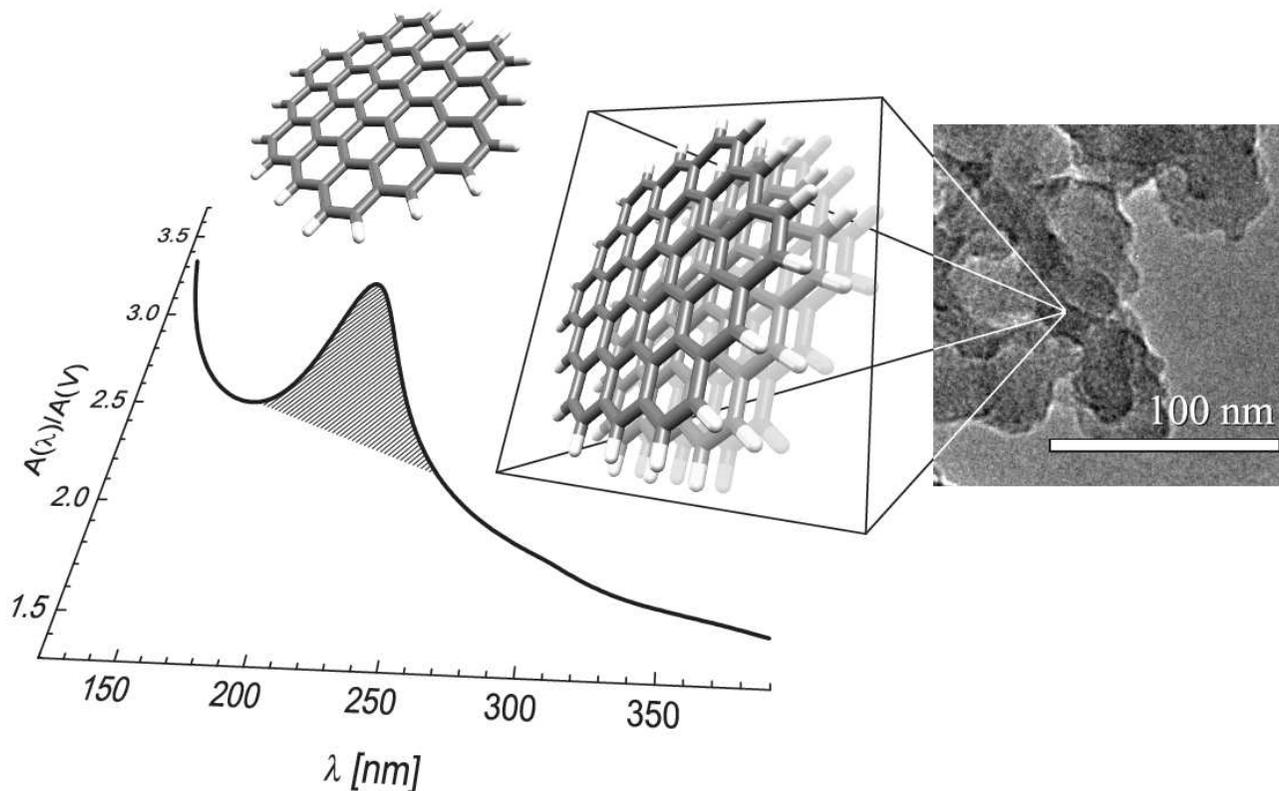

Absorption spectra of different PAH mixtures in Ne @ 6 K

Summary

- The interstellar UV bump can arise from π - π^* resonances of small aromatic islands (~ 50 C atoms) as they are present, e.g., in the PAHs that are responsible for the aromatic IR emission bands.

- No absorption band specific for a certain PAH (measured so far) has been detected in the ISM. "Normal" PAHs are probably not responsible for the DIBs.

Absorption spectra via matrix isolation spectroscopy

gas flow 2 – 8 ml min⁻¹
duration 0.25 – 4 h

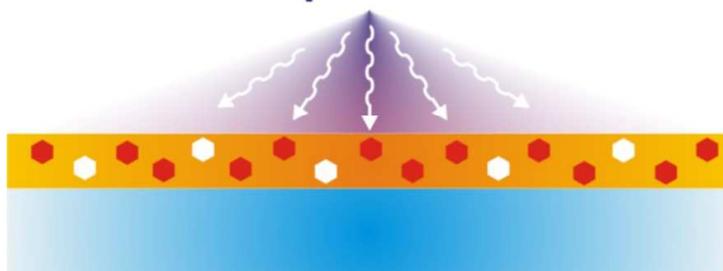

matrix preparation

$N_{\text{Ne}} \times N^{-1}_{\text{molecule}} \approx 300 - 30\,000$

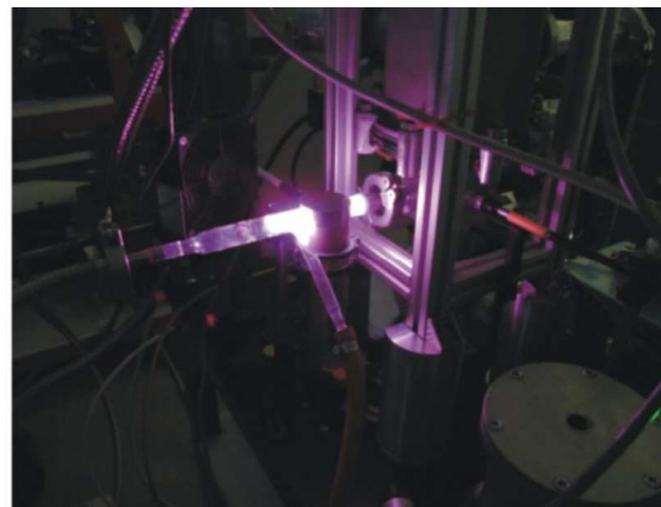

matrix preparation

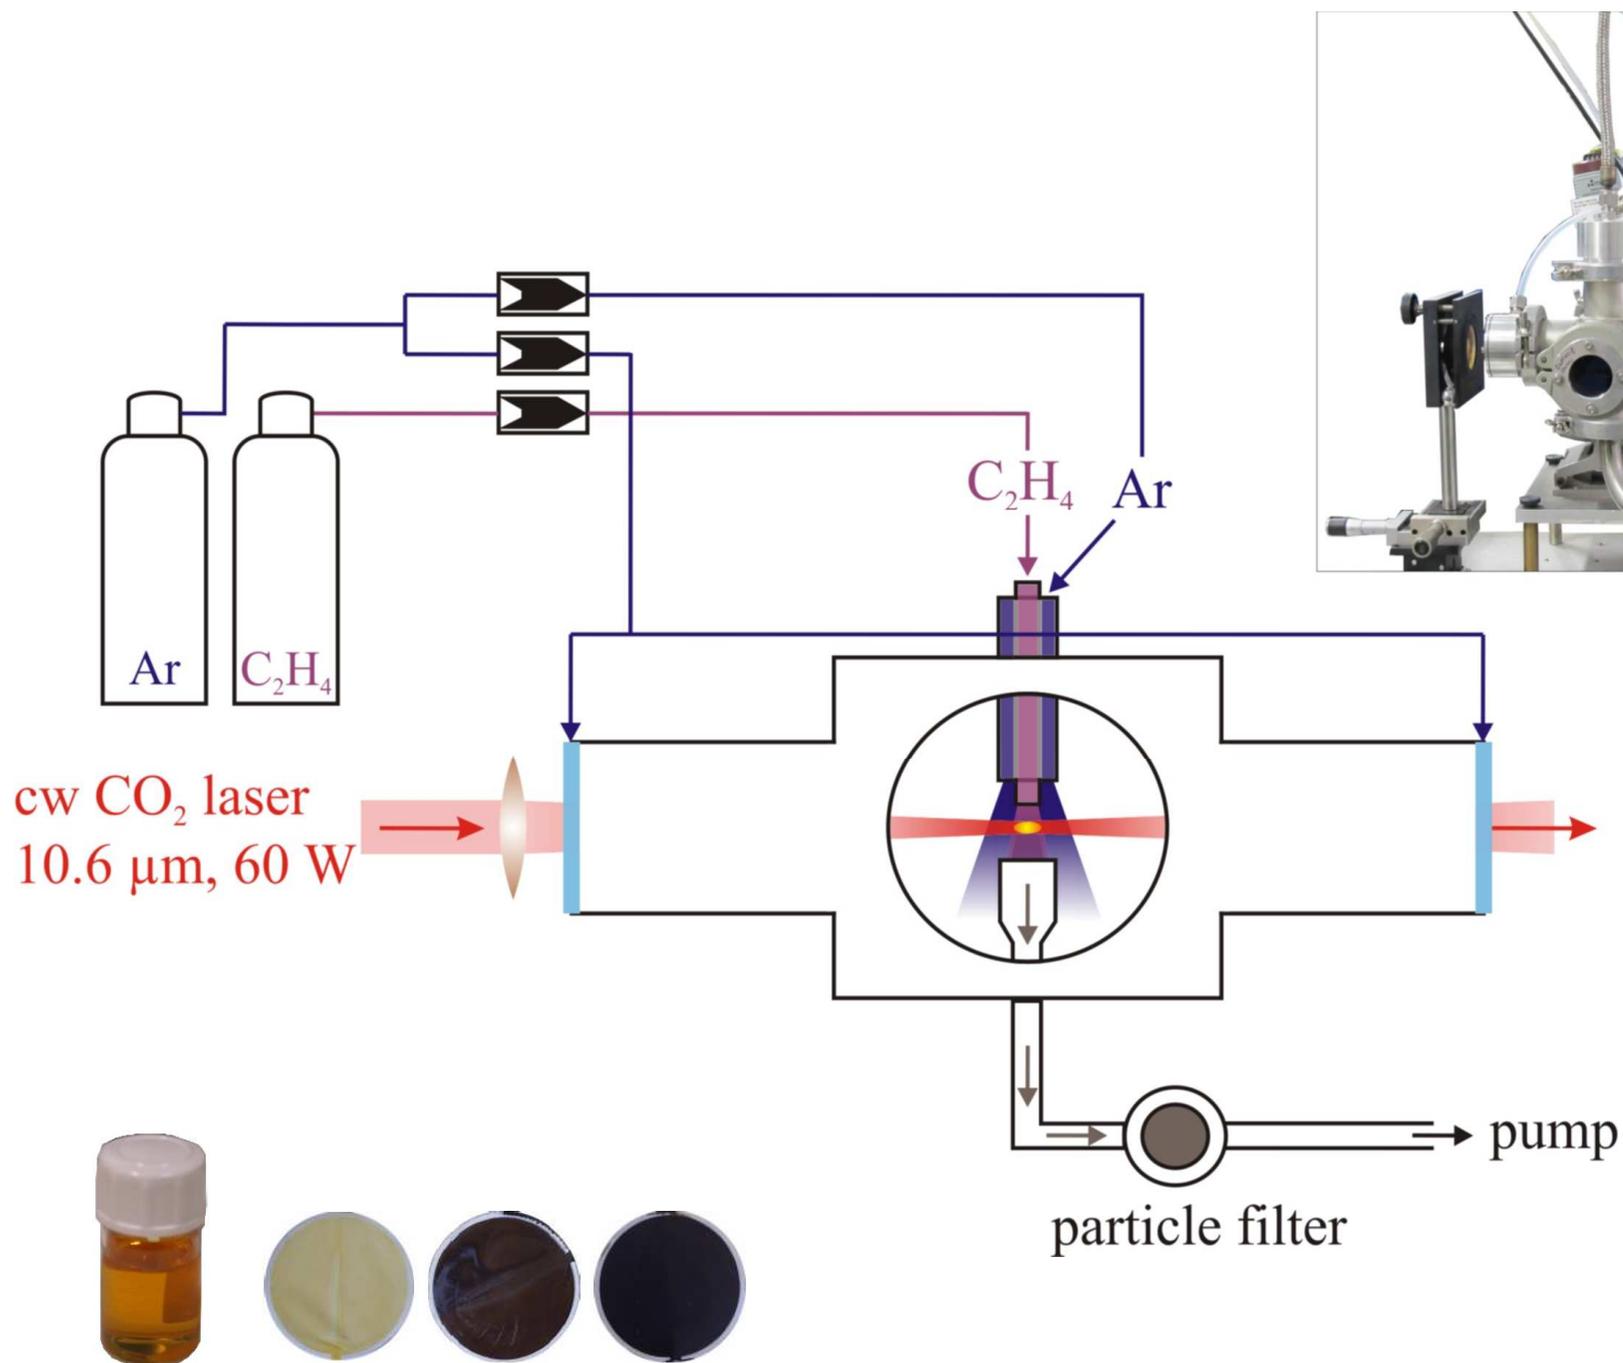

10.2 – 11.8 eV (122 – 105 nm)
 $10^{15} - 10^{16}$ photons m⁻² s⁻¹

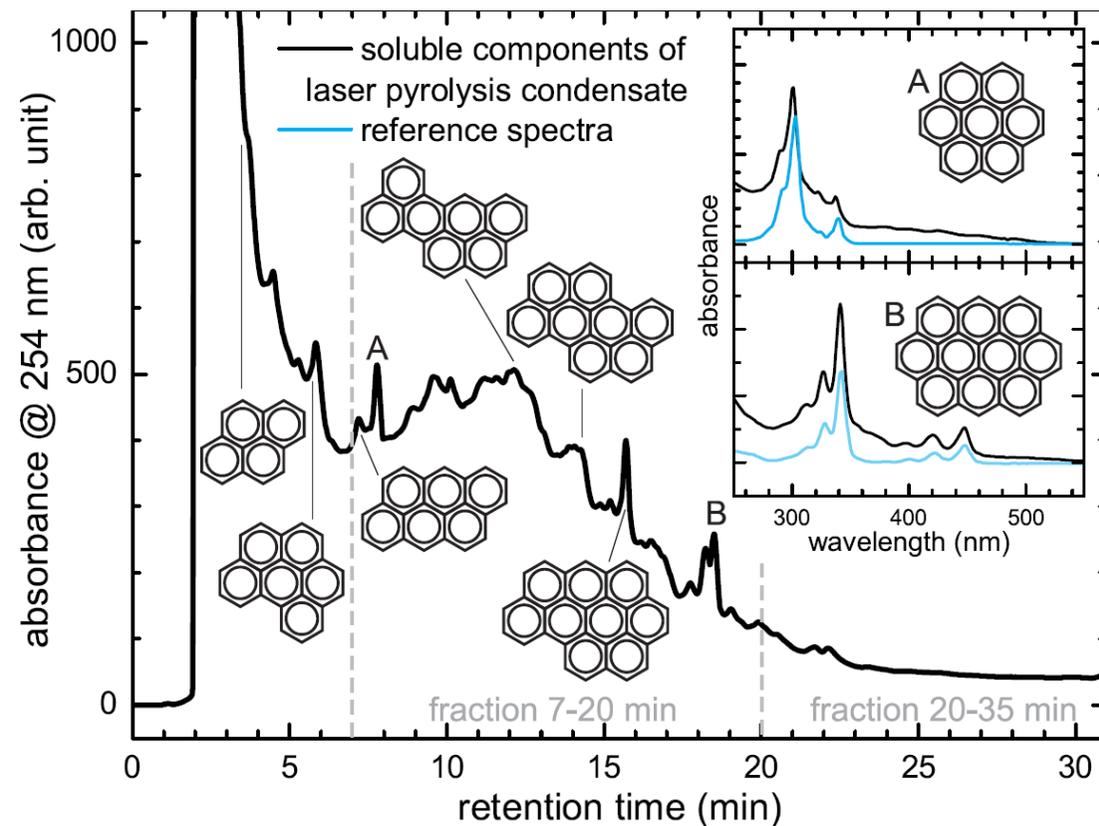

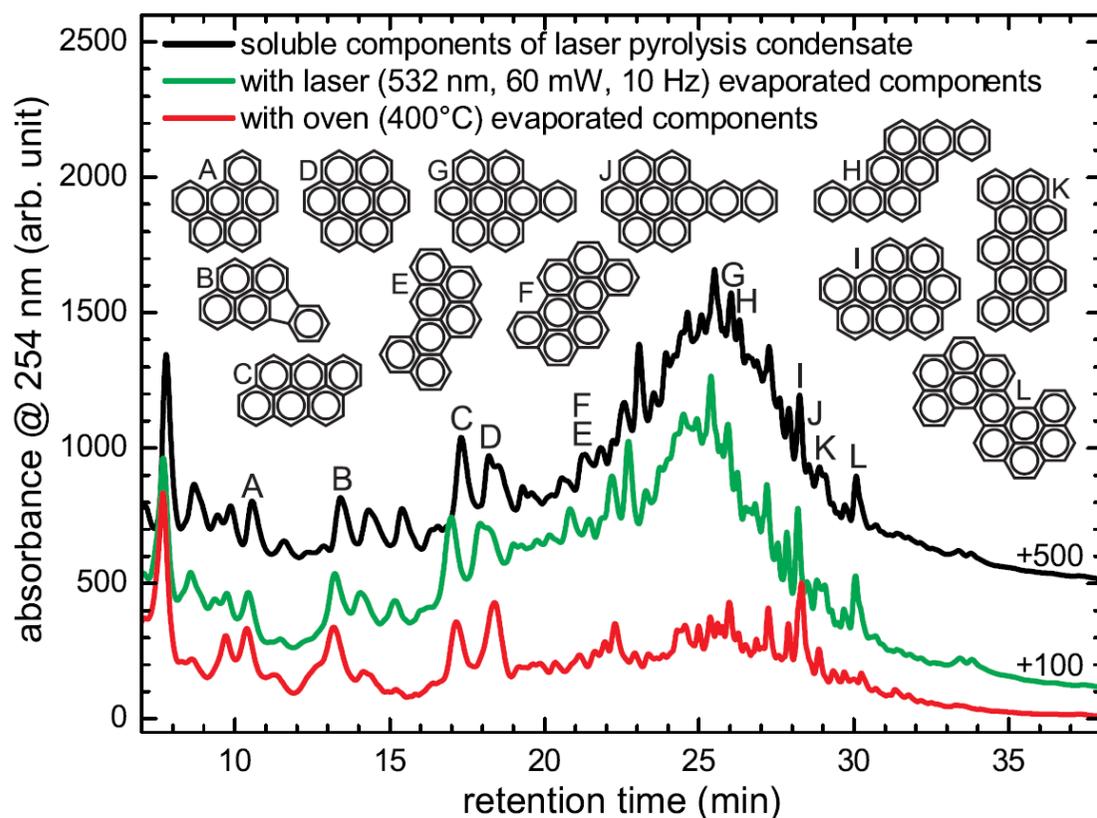

FUV irradiation (optional)

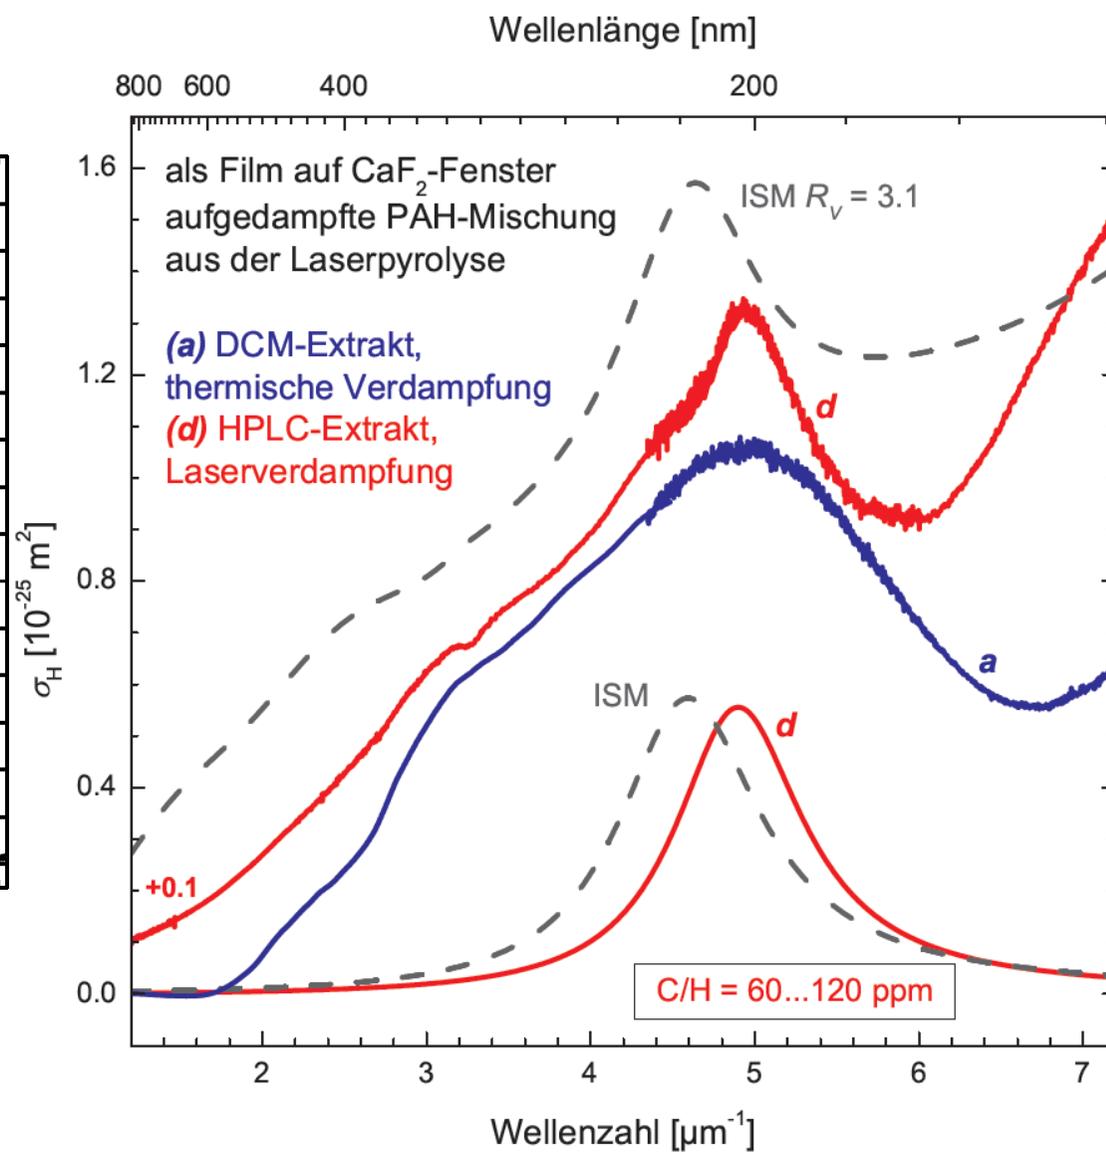

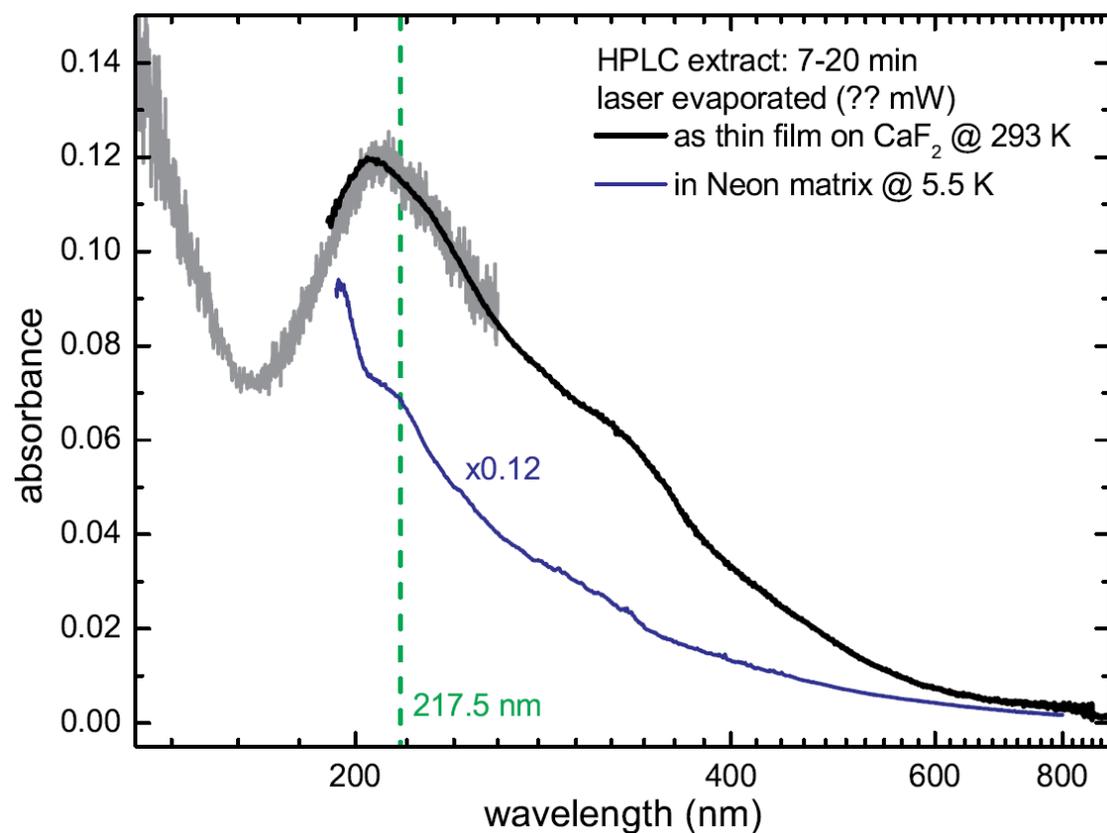

PAH synthesis via laser pyrolysis

HPLC analysis of soluble condensate

Absorption spectra of PAH mixtures as thin solid film

Semi-empirically calculated absorption spectra of PAH mixtures
